Outline

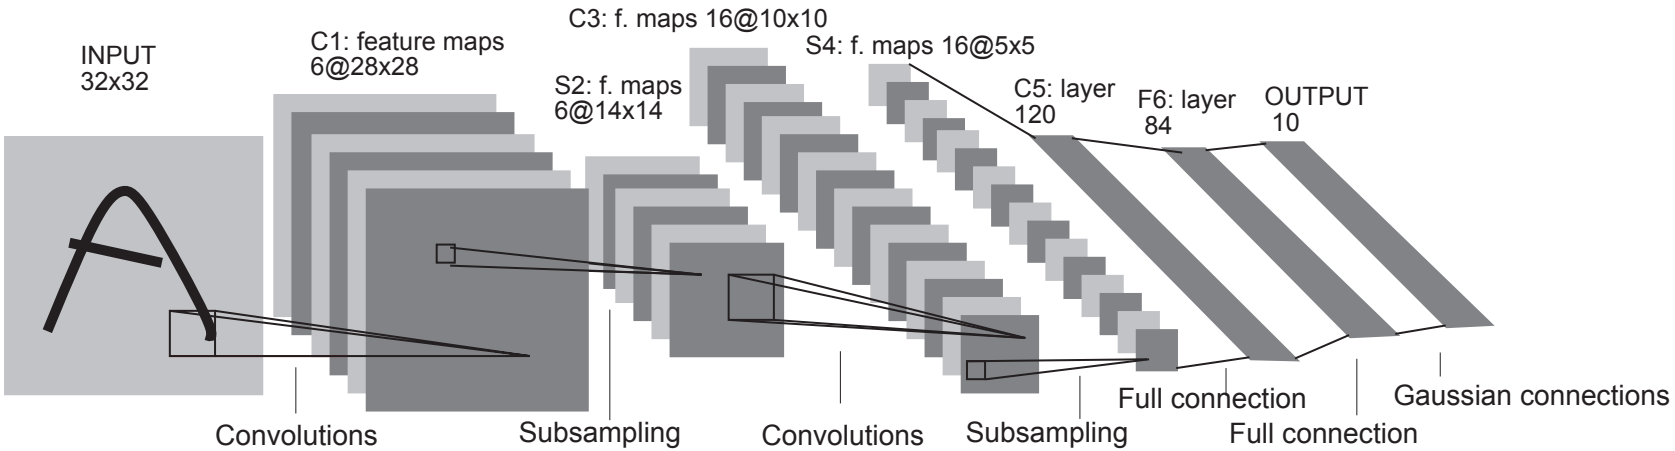
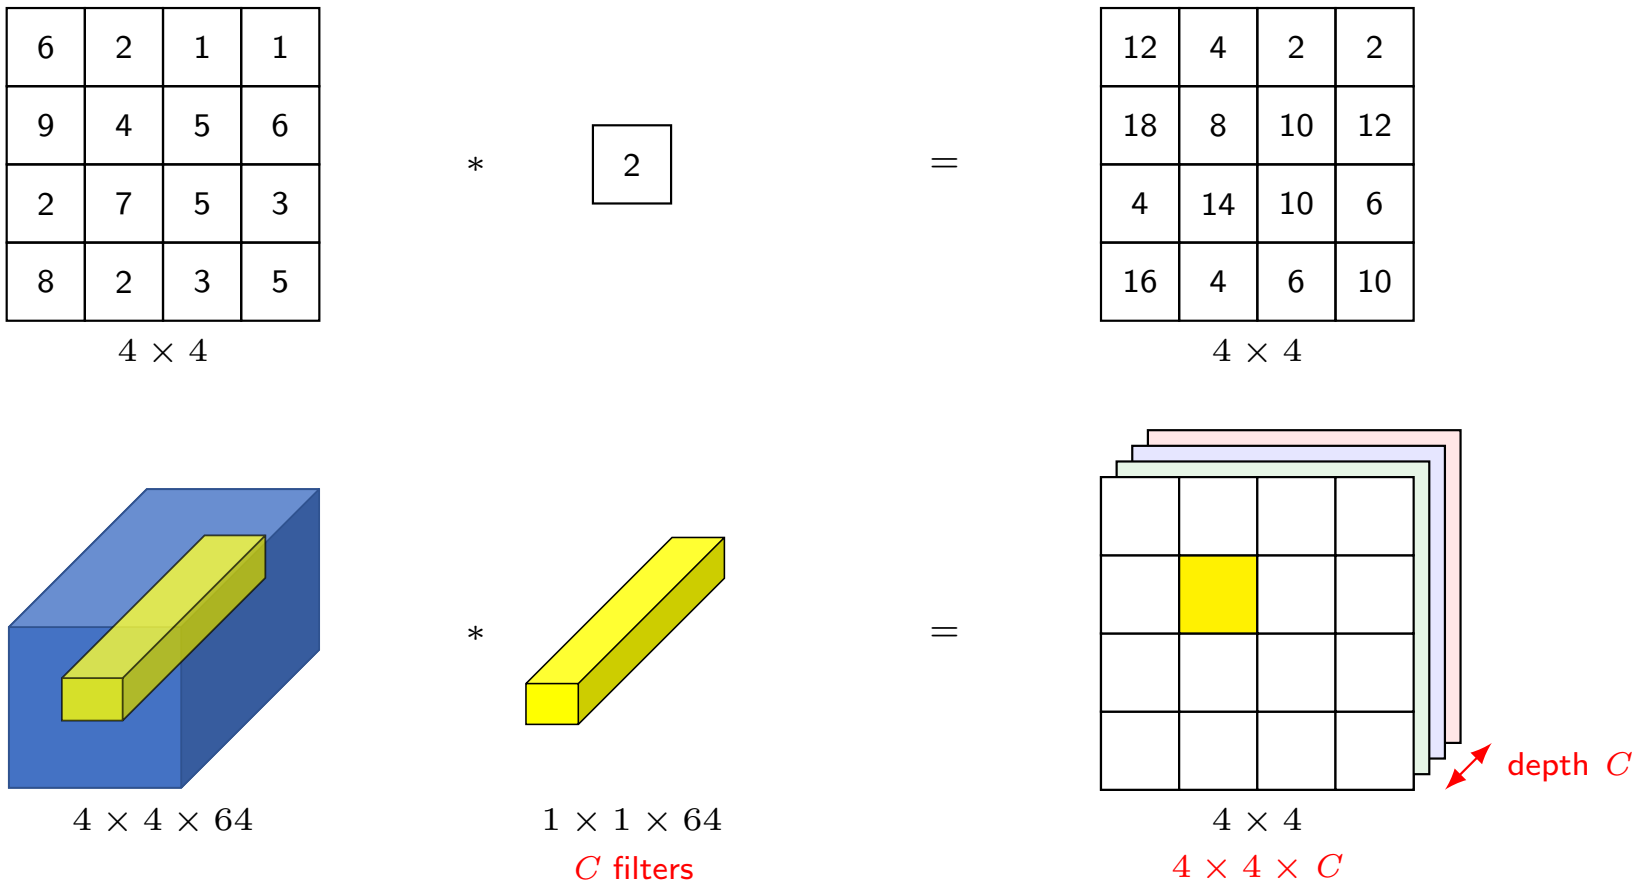
Classic: LeNet-5



(source: LeCun, 1998)

- CONV-POOL-CONV-POOL-FC-FC
  - 5×5 conv filters (stride 1)
  - 2×2 pooling layers (stride 2)

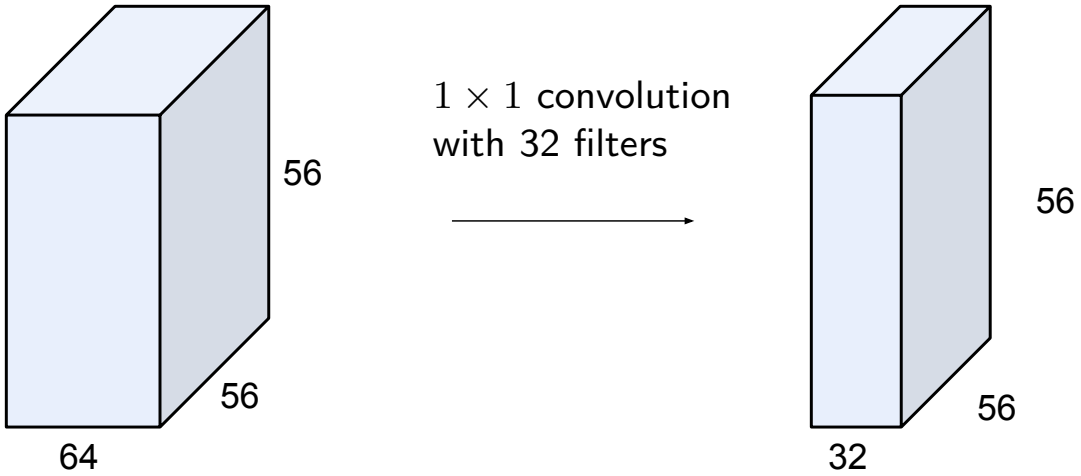
1×1 convolution on volumes



(source: coursera)

- nonlinearity (*e.g.* ReLU) can follow 1×1 convolution $\rightarrow$ "network in network"

- 1×1 convolution: widely used for depth adjustment
- example:



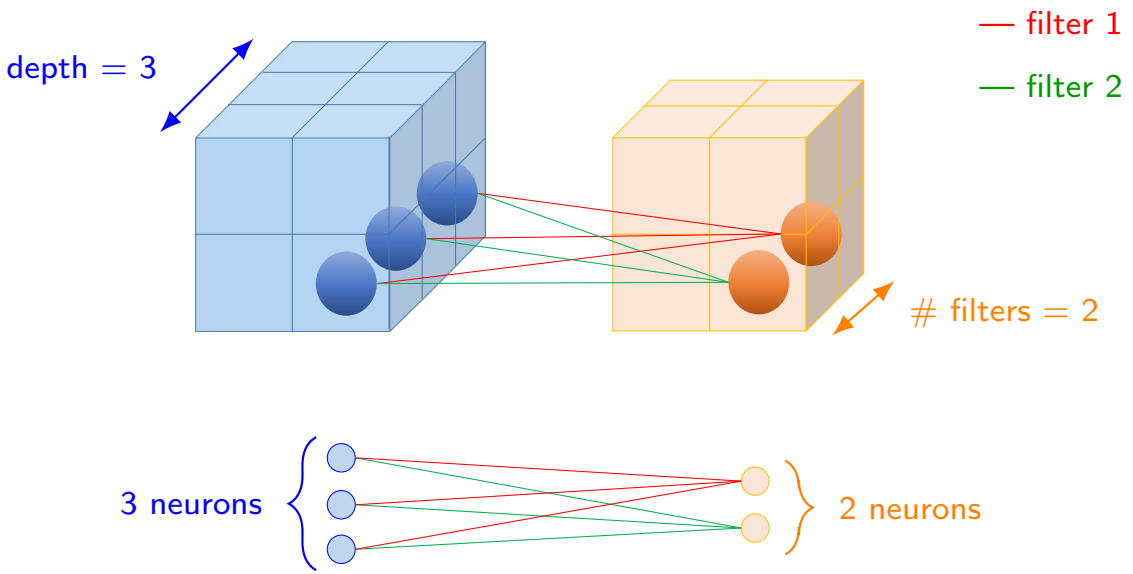
(source: cs231n)

  - each filter: size $1 \times 1 \times 64$ (performs a 64-dim dot product)
  - preserves spatial dimensions and reduces depth
  - projects depth to lower dimension (combination of feature maps)

- in general
  - we can reduce/maintain/increase depth using 1×1 convolution

- a set of 1×1 conv filters: can be interpreted as forming an FC layer
  - input dimension of this FC layer
    $=$ depth of the input volume to 1×1 conv filters
  - output dimension of this FC layer
    $=$ number of 1×1 conv filters

- example: $2 \times 2 \times 3$ volume applied to two $1 \times 1 \times 3$ filters
  - $2 \times 2 = 4$ instances of an FC layer, which maps 3 neurons to 2 neurons

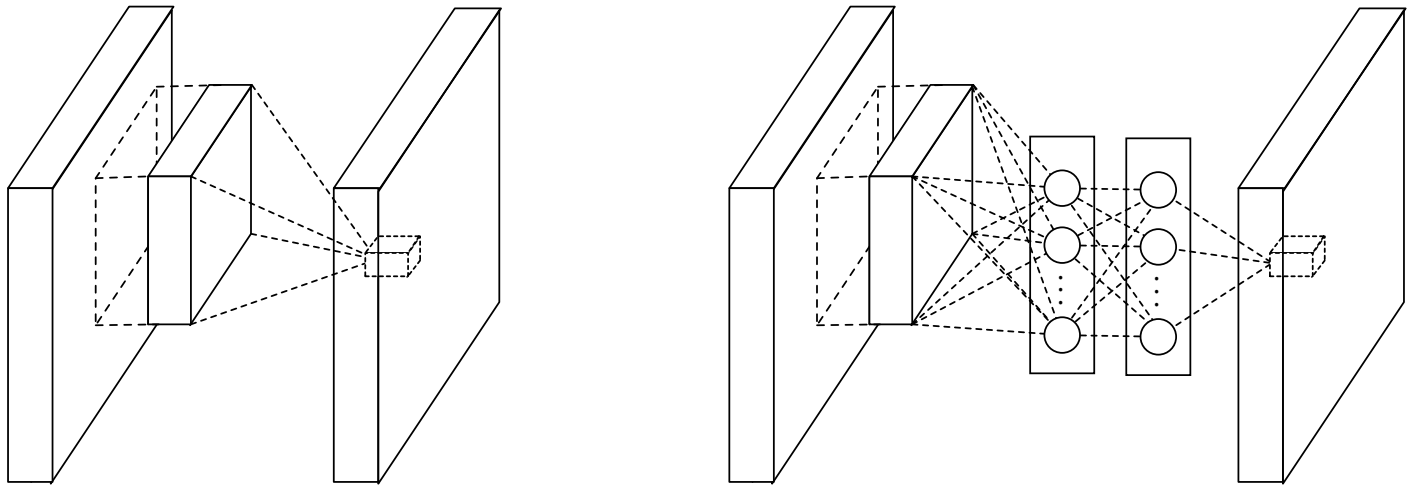


Network in network

- Mlpconv layer with "micro network" within each conv layer

  ↑ composed of FC layer (with 1×1 conv) + nonlinearity

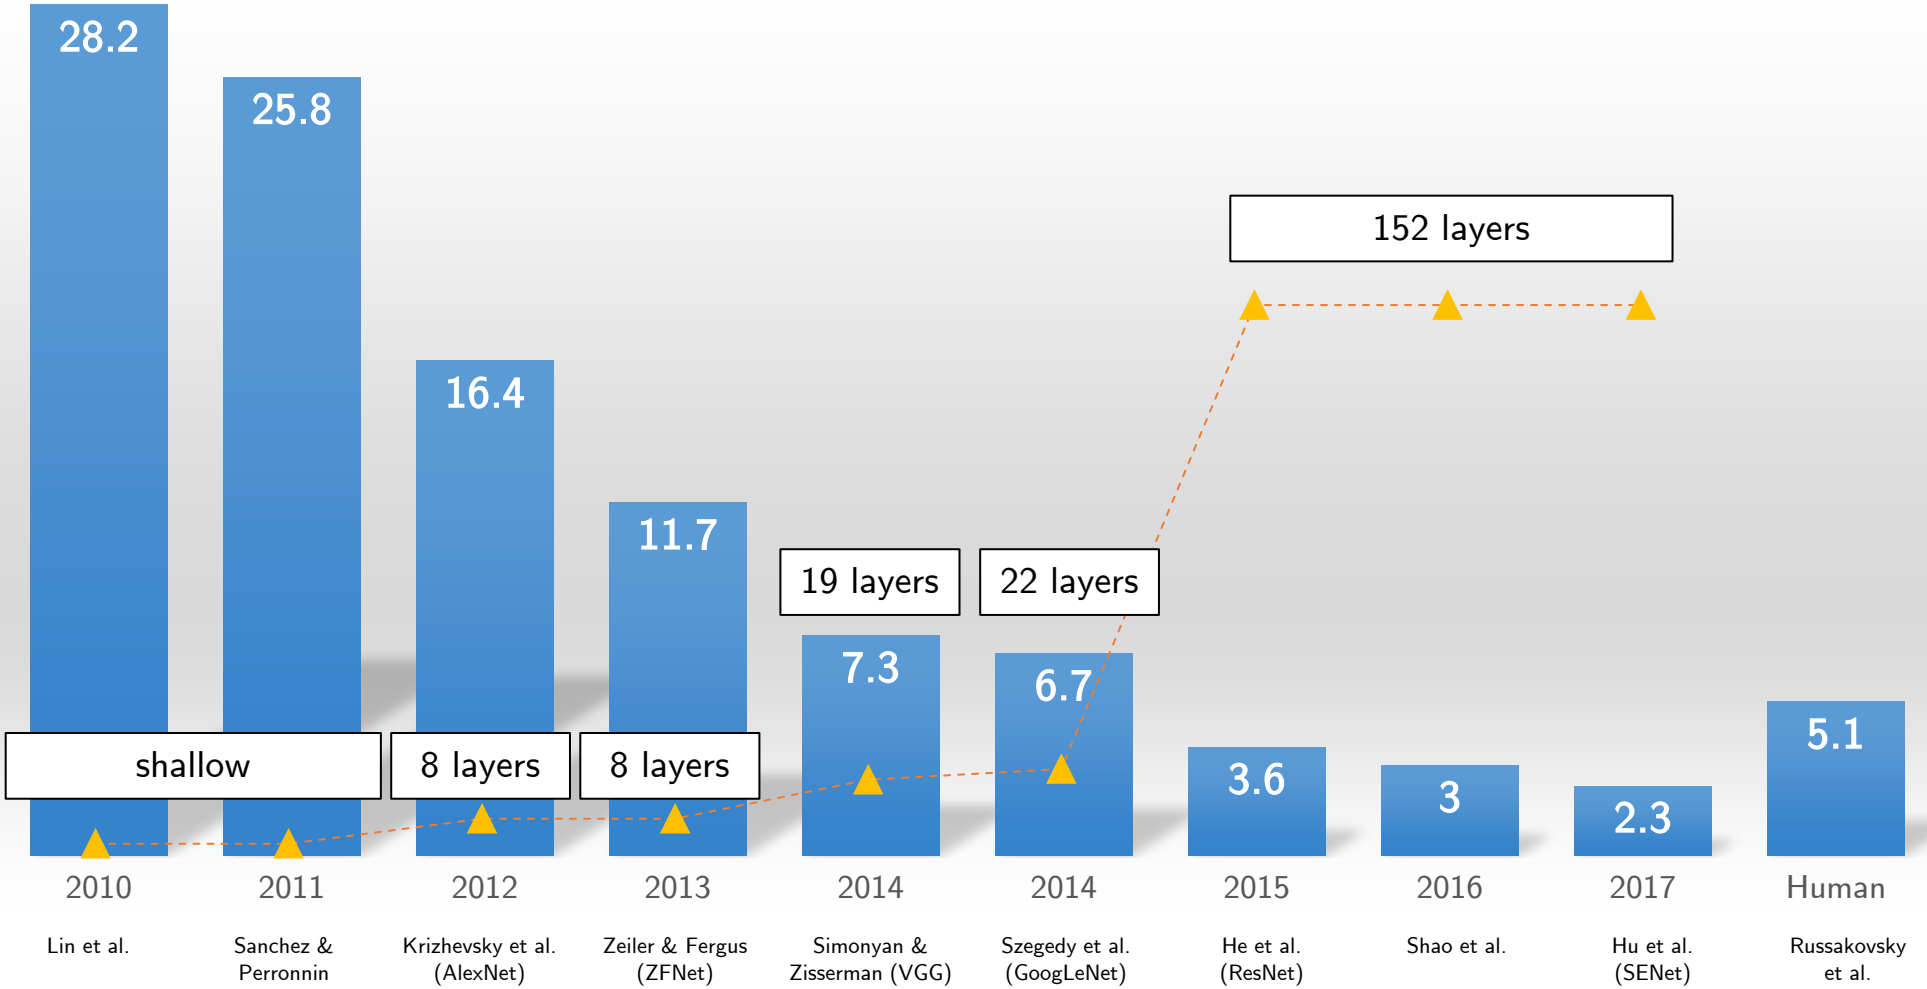
  - can compute more abstract features for local patches
  - precursor to GoogLeNet and ResNet "bottleneck" layers



(a) linear convolution layer (b) Mlpconv layer

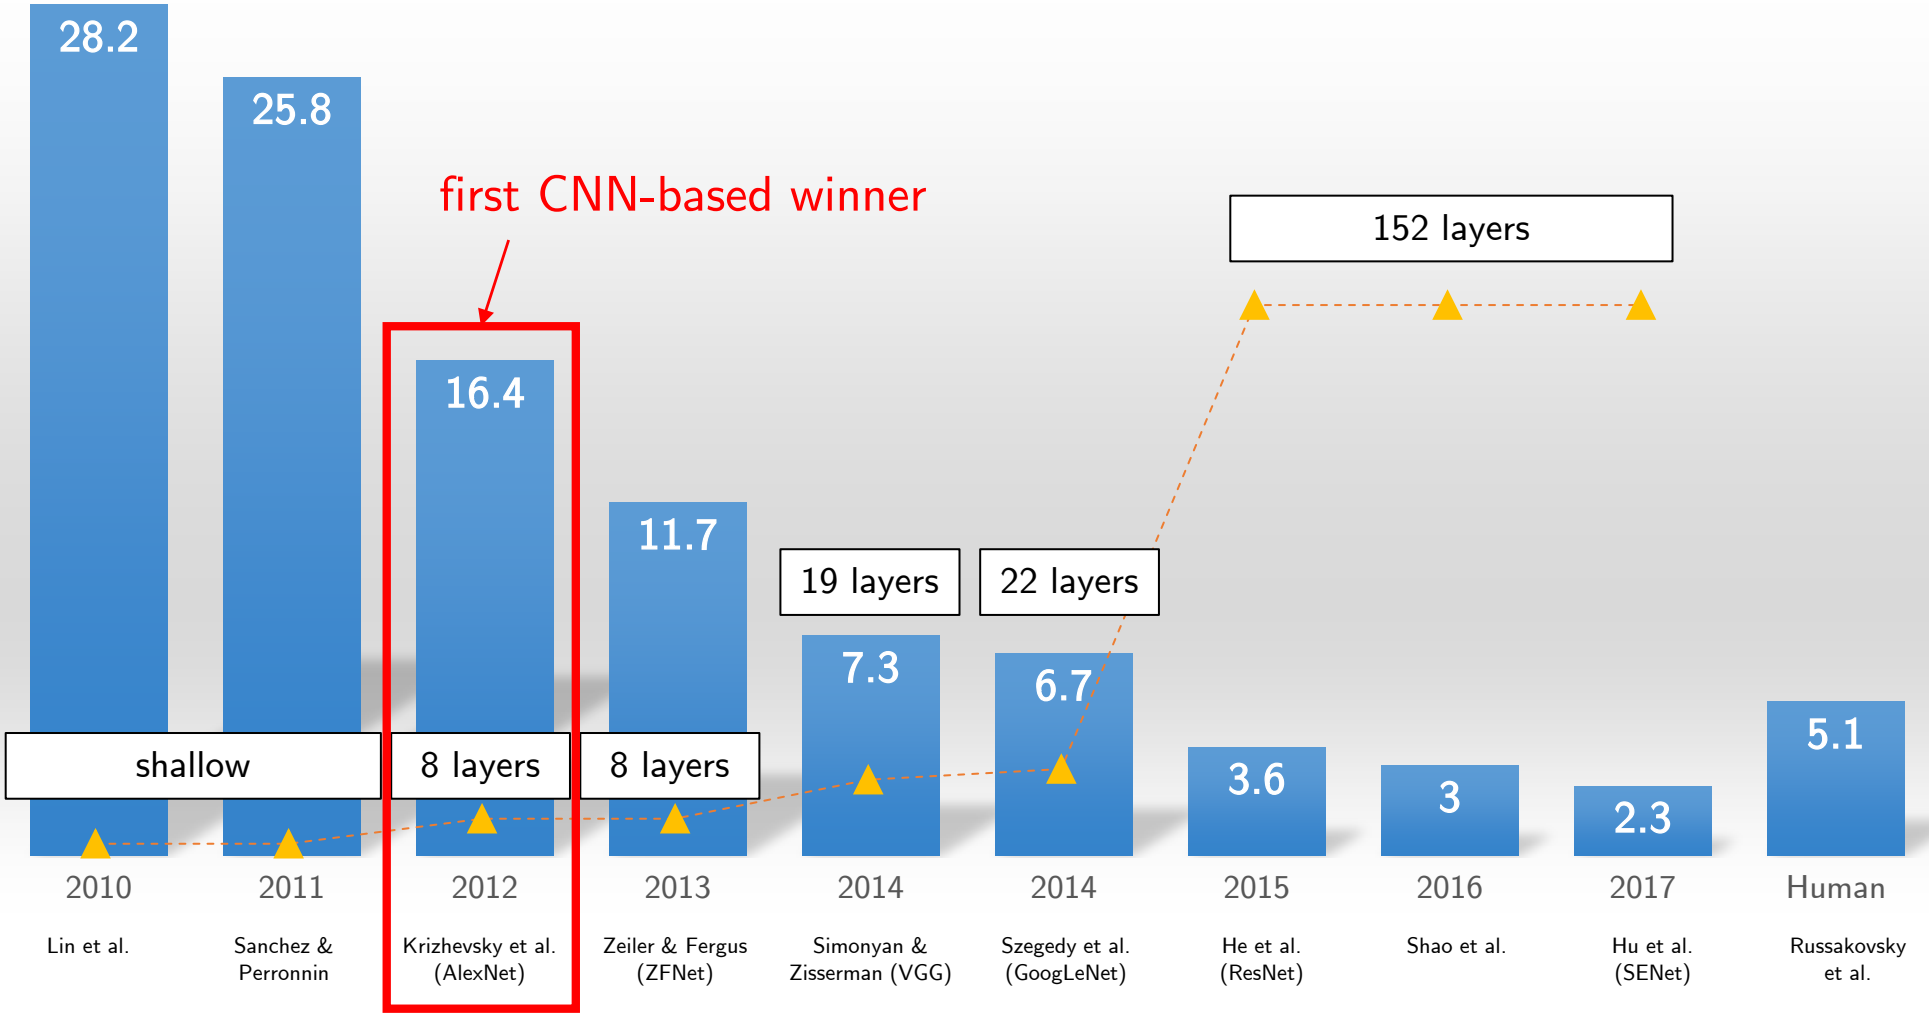
(source: Lin et al., 2014)

ImageNet challenge winners



Outline

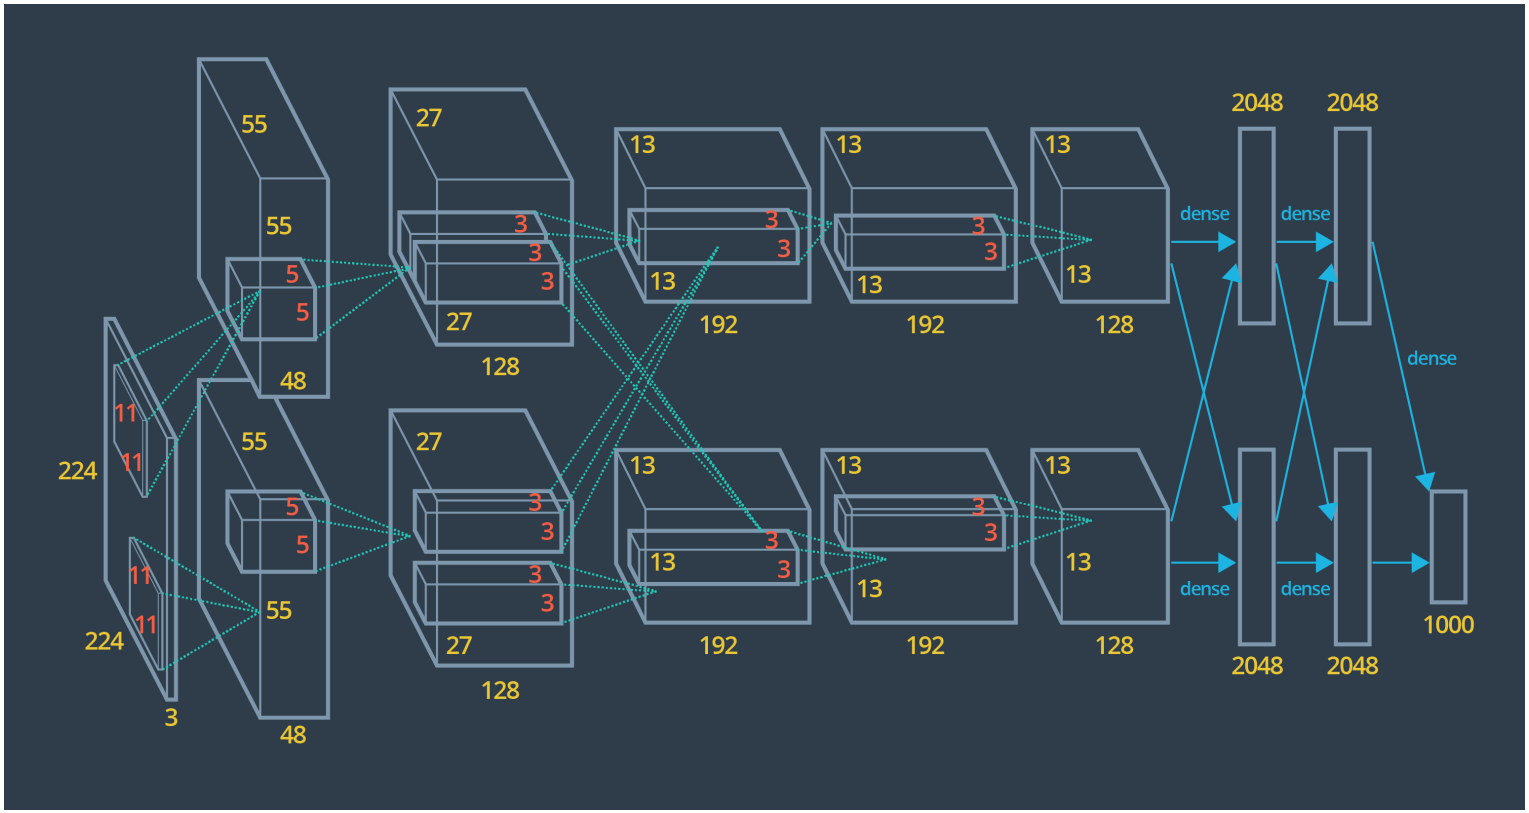
ImageNet challenge winners



AlexNet

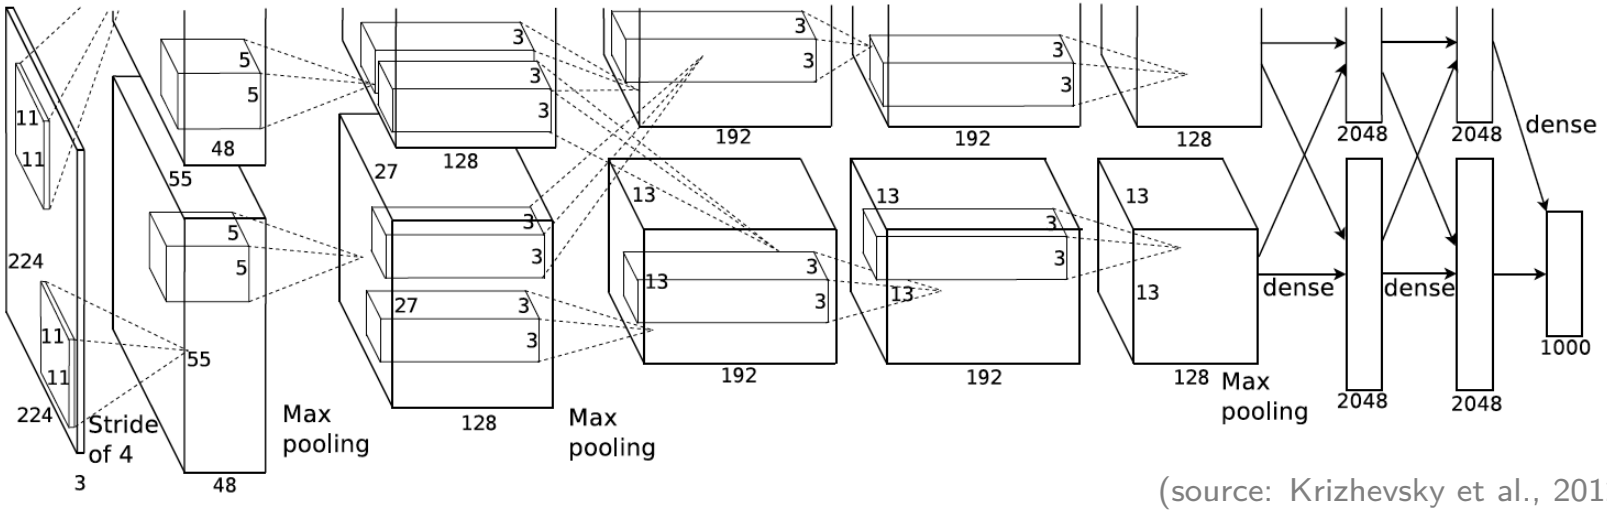
- Alex Krizhevsky, Ilya Sutskever, Geoffrey Hinton (2012)
  - ILSVRC 2012 winner

원래 1개로 되는데 그래픽 카드가 후져서 2개로 나누어서 수행했음



(source: yuchao.us)

Architecture



(source: Krizhevsky et al., 2012)

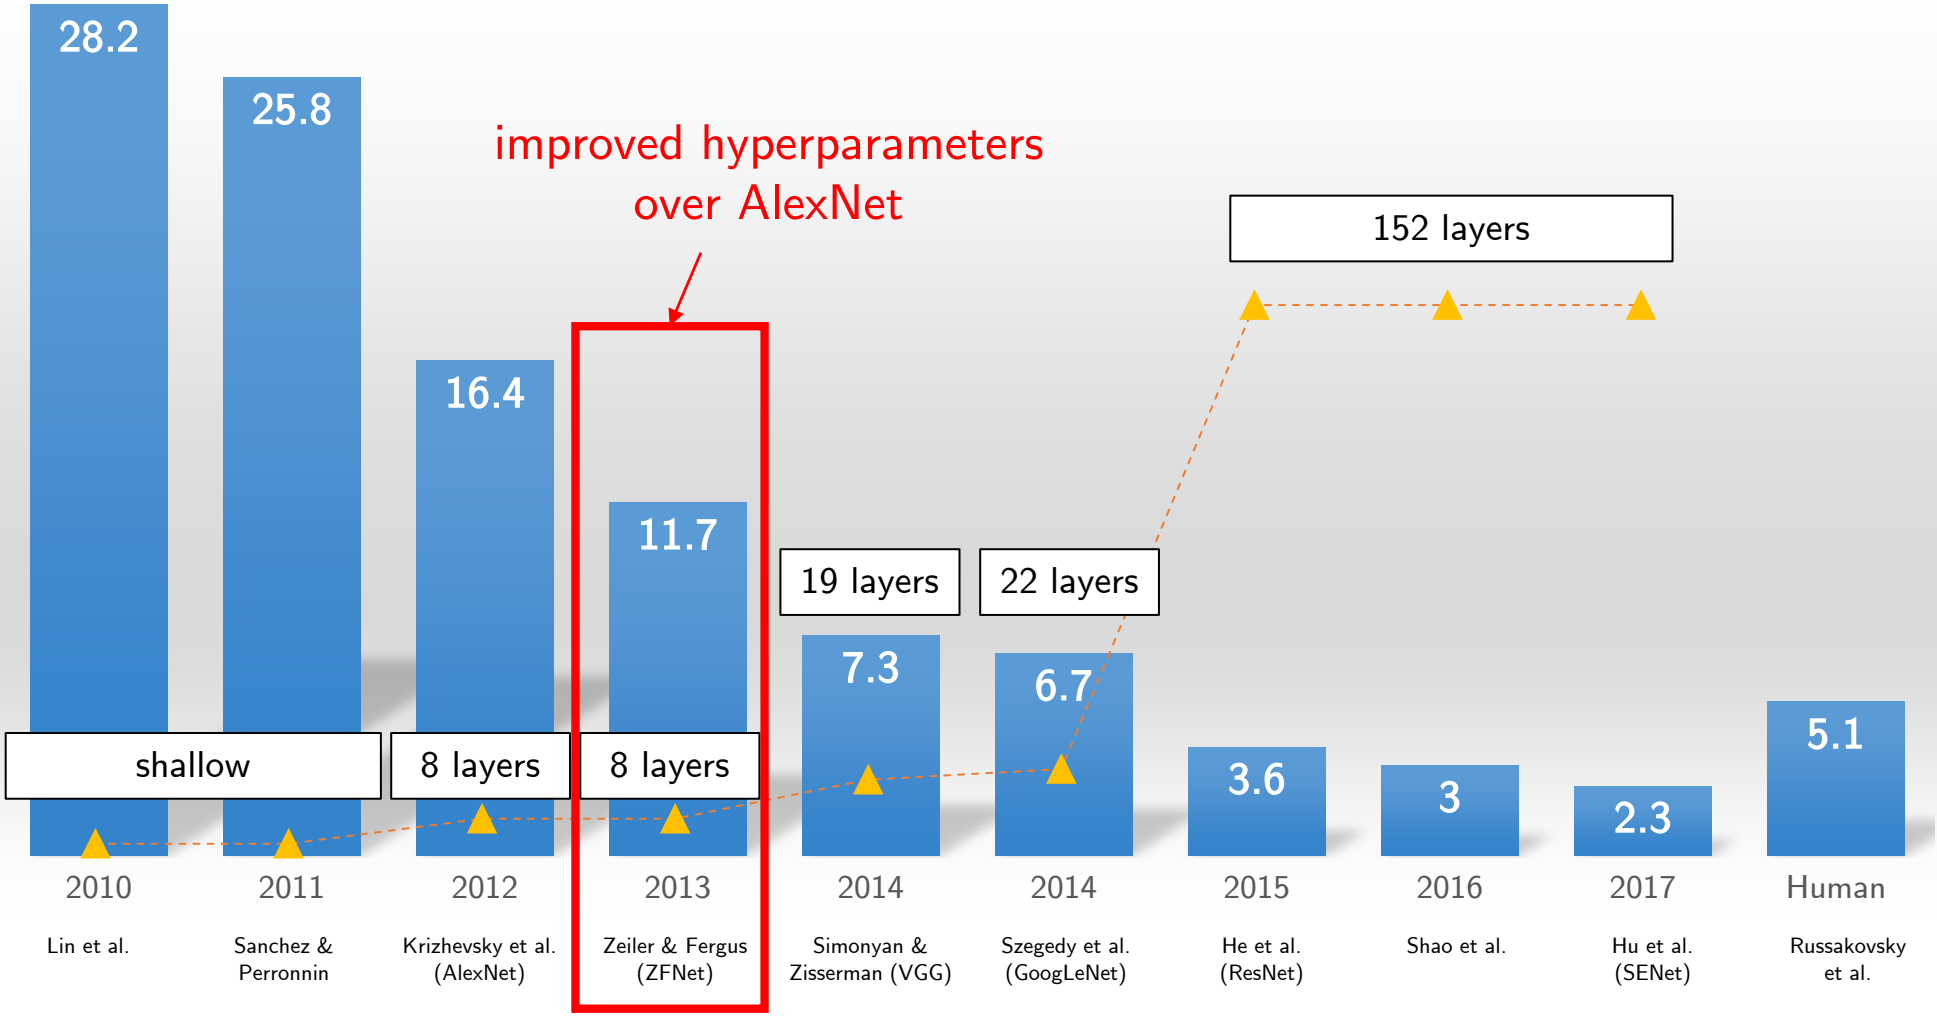
227x227x3	INPUT	
55x55x96	CONV1	96 11x11 filters at stride 4, pad 0
27x27x96	MAX POOL1	3x3 filters at stride 2
27x27x96	NORM1	normalization layer
27x27x256	CONV2	256 5x5 filters at stride 1, pad 2
13x13x256	MAX POOL2	3x3 filters at stride 2
13x13x256	NORM2	normalization layer
13x13x384	CONV3	384 3x3 filters at stride 1, pad 1
13x13x384	CONV4	384 3x3 filters at stride 1, pad 1
13x13x256	CONV5	256 3x3 filters at stride 1, pad 1
6x6x256	MAX POOL3	3x3 filters at stride 2
4096	FC6	4096 neurons
4096	FC7	4096 neurons
1000	FC8	1000 neurons (class scores)

- total number of parameters
  - 60M

- details:
  - first use of ReLU
  - used normalization (NORM) layers (not common anymore) -> 현재는 batch norm 이용
  - heavy data augmentation
  - dropout: 0.5
  - batch size: 128
  - SGD + momentum (0.9)
  - learning rate: 10^{-2}
    (reduced by 10 manually when validation accuracy plateaus)
  - L2 weight decay: 5×10^{-4}
  - 7 CNN ensemble: 18.2% $\rightarrow$ 15.4%

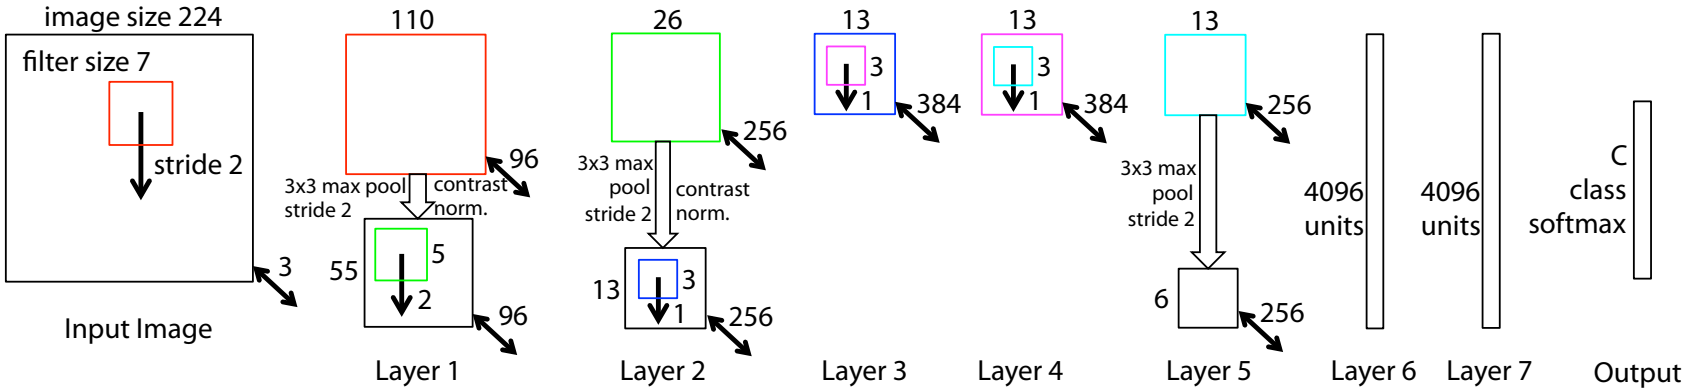
- trained on GTX 580 GPU (only 3GB memory)
  - network spread across 2 GPUs

ImageNet challenge winners



ZFNet (Zeiler and Fergus, 2013)

hyperparameter 튜닝 외의 의미는 없음

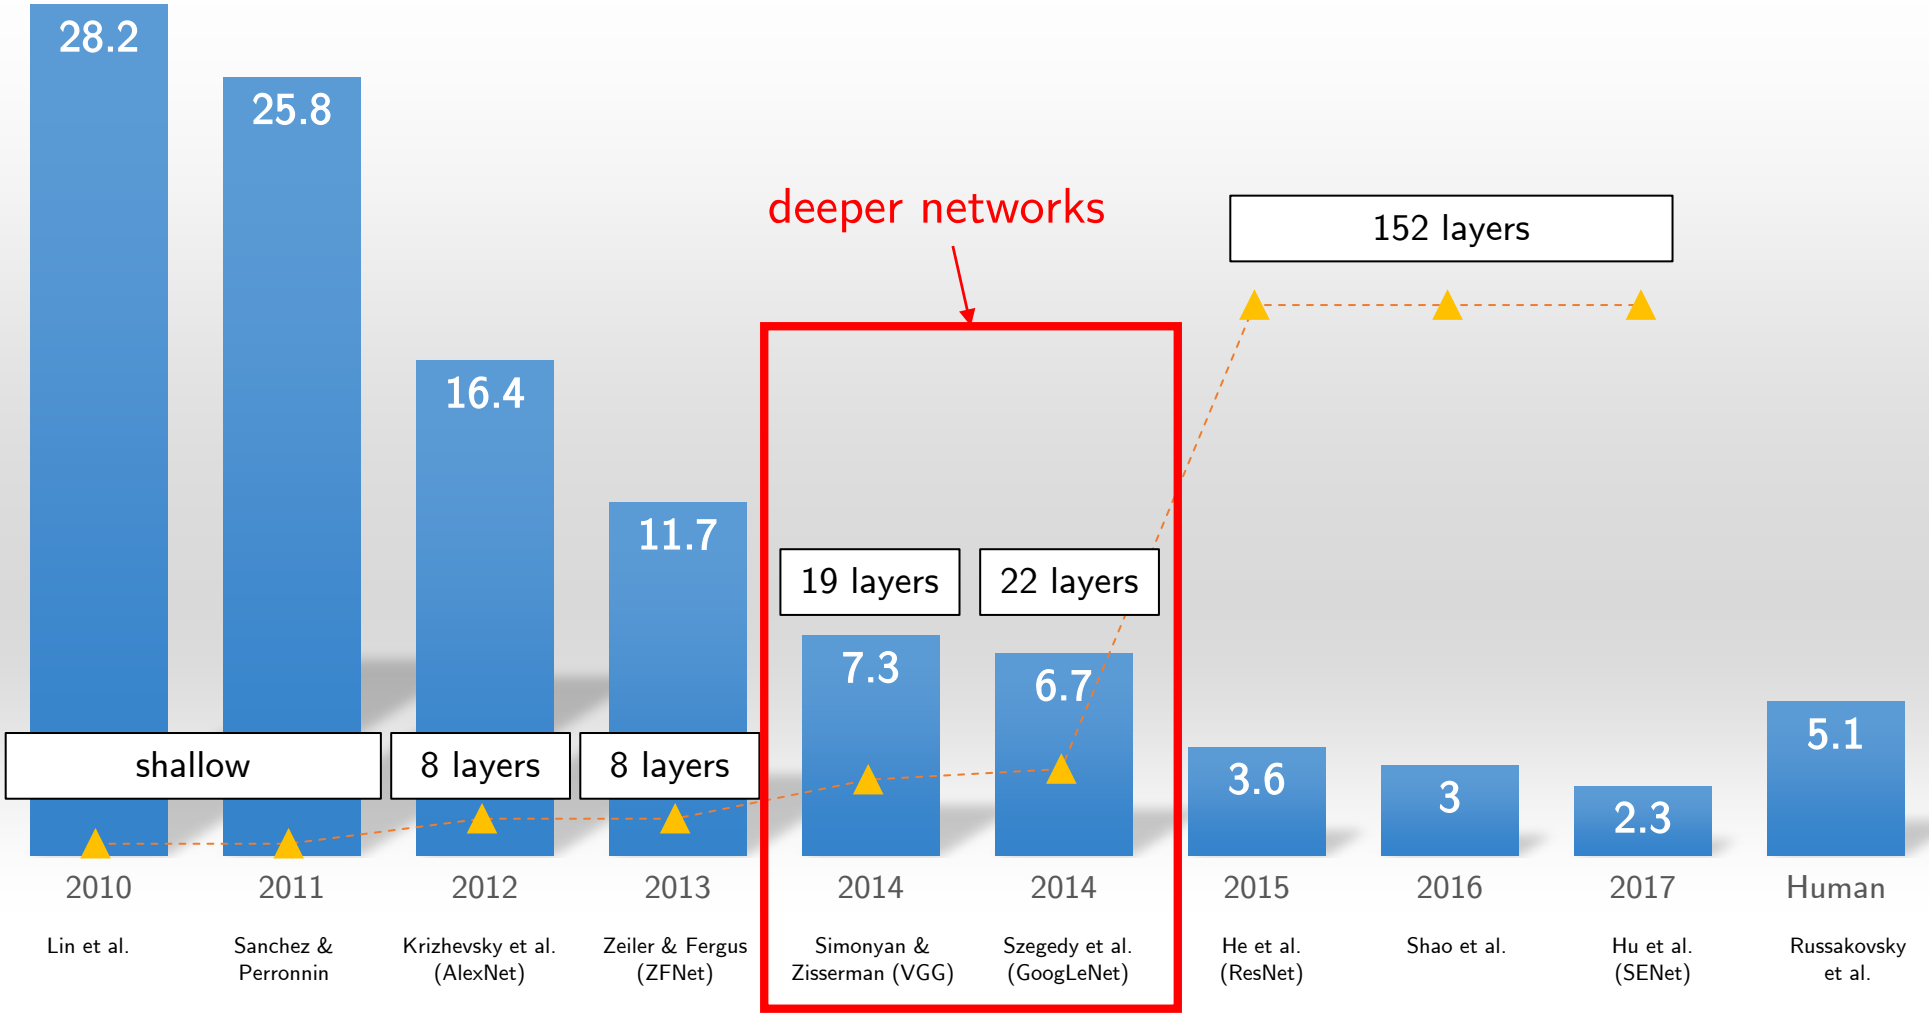


(source: Zeiler and Furgus, 2013)

- the same as AlexNet but
  - CONV1: change from (11x11 stride 4) to (7x7 stride 2)
  - CONV3, 4, 5: instead of 384, 384, 256 filters use 512, 1024, 512
  - ImageNet top 5 error: 16.4% $\rightarrow$ 11.7%

Outline

ImageNet challenge winners



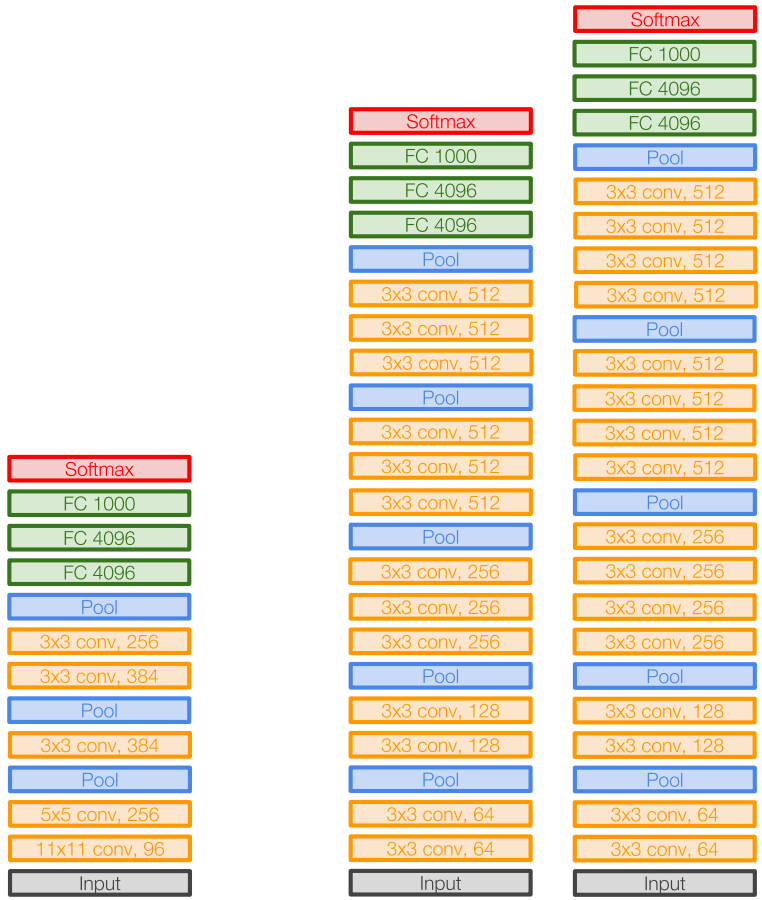
VGG

cisk vs risk에서 처럼 간단한 filter를 쓰되 'deep'하게 쓰자!!!

- Simonyan and Zisserman (2014)
- key idea: small filters, deeper networks
  - only

    3x3 CONV stride 1, pad 1

    2x2 MAX POOL stride 2
- ILSVRC top 5 error
  - 11.7% (ZFNet, 2013)
    → 7.3% (VGG, 2014)
- two versions: VGG16, VGG19
  - VGG19 only slightly better
    (use more memory)



(source: cs231n)

Why use smaller filters?

- consider stacking three 3x3 conv (stride 1) layers

- benefits
  - its effective receptive field
  - $=$ that of one $\overset{7x7}{\underline{\quad}}$ conv layer

  - but deeper
  - $\Rightarrow$ more non-linearities

  - and fewer parameters[1]:
    $3 \times (3^2 C^2)$ vs $7^2 C^2$

7x7 필터 1겹 == 3x3 필터 3겹(size의 측면에서)
but 더 deep 하기 때문에 non-linearity에서 좋고
parameter 숫자도 더 적음
7x7 => 49, 3x3x3 = 27

(source: cs231n)

[1] assuming C channels per layer and C filters per layer

Architecture (VGG16)

parameter 꽤 많음 (AlexNet이 10M개였음)

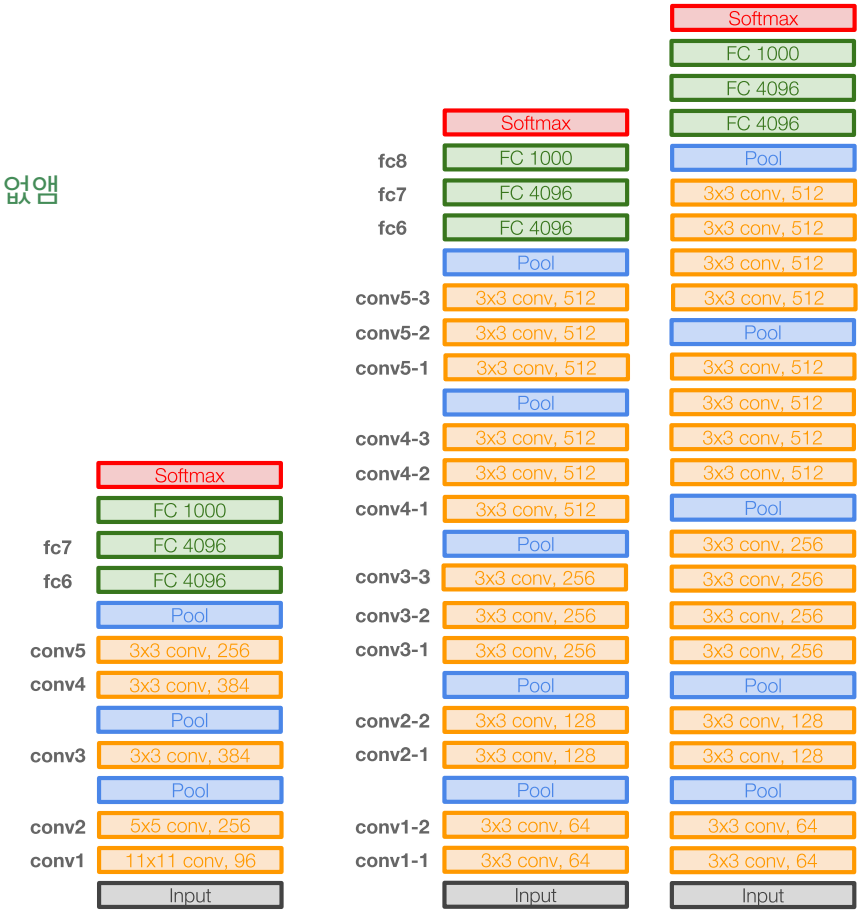
layer type	dimension	memory (96MB/image)	parameters (138M total)
INPUT	224x224x3	224*224*3=150K	0
CONV3-64	224x224x64	224*224*64=3.2M	(3*3*3)*64 = 1,728
CONV3-64	224x224x64	224*224*64=3.2M	(3*3*64)*64 = 36,864
POOL2	112x112x64	112*112*64=800K	0
CONV3-128	112x112x128	112*112*128=1.6M	(3*3*64)*128 = 73,728
CONV3-128	112x112x128	112*112*128=1.6M	(3*3*128)*128 = 147,456
POOL2	56x56x128	56*56*128=400K	0
CONV3-256	56x56x256	56*56*256=800K	(3*3*128)*256 = 294,912
CONV3-256	56x56x256	56*56*256=800K	(3*3*256)*256 = 589,824
CONV3-256	56x56x256	56*56*256=800K	(3*3*256)*256 = 589,824
POOL2	28x28x256	28*28*256=200K	0
CONV3-512	28x28x512	28*28*512=400K	(3*3*256)*512 = 1,179,648
CONV3-512	28x28x512	28*28*512=400K	(3*3*512)*512 = 2,359,296
CONV3-512	28x28x512	28*28*512=400K	(3*3*512)*512 = 2,359,296
POOL2	14x14x512	14*14*512=100K	0
CONV3-512	14x14x512	14*14*512=100K	(3*3*512)*512 = 2,359,296
CONV3-512	14x14x512	14*14*512=100K	(3*3*512)*512 = 2,359,296
CONV3-512	14x14x512	14*14*512=100K	(3*3*512)*512 = 2,359,296
POOL2	7x7x512	7*7*512=25K	0
FC	1x1x4096	4096	7*7*512*4096 = 102,760,448
FC	1x1x4096	4096	4096*4096 = 16,777,216
FC	1x1x1000	1000	4096*1000 = 4,096,000

- most memory: in early conv layer
- most parameters: in late fc layer

VGG16

- ILSVRC'14 ranking: 2nd in classification, 1st in localization
- details:
  - similar training procedure as AlexNet
  - no local response normalization (LRN) — normalization layer 없앰
  - use ensembles for best results
  - FC7 features generalize well to other tasks

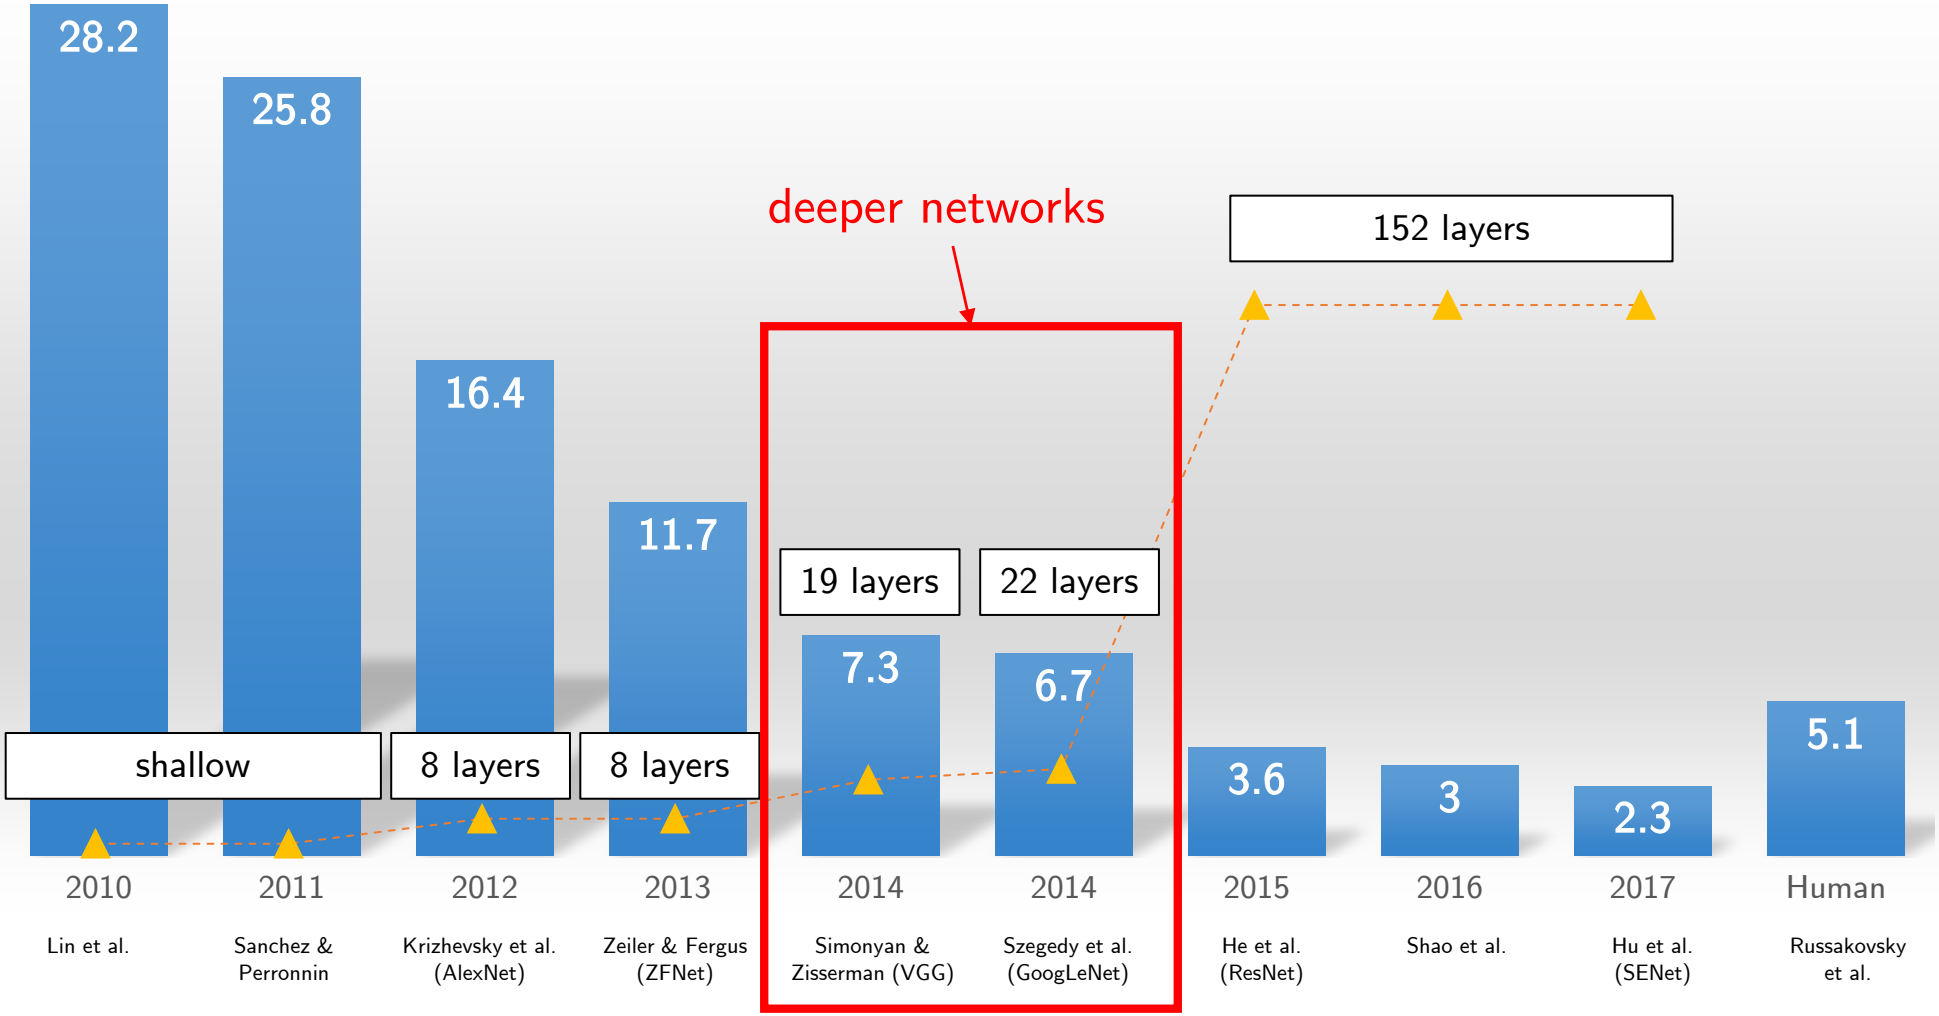
FC7 layer가 generalize가 잘되서 train이 끝난 후 이 layer만 빼서 FC8 layer(classifier)만 바꿔서 쓸 수 있음



(source: cs231n)

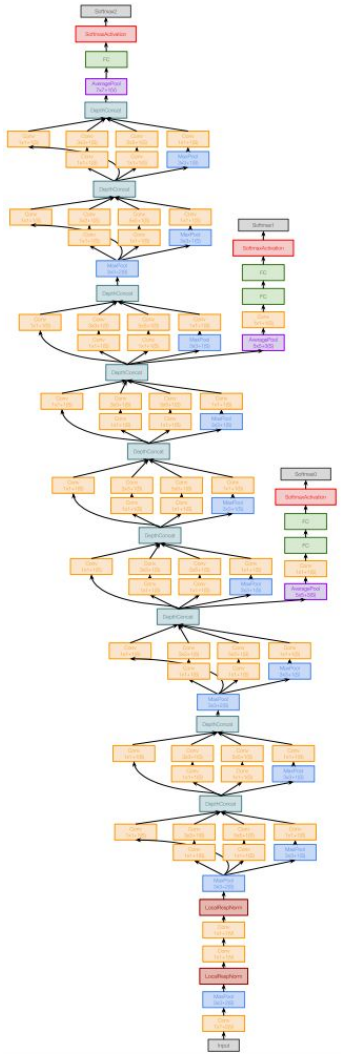
Outline

ImageNet challenge winners



GoogLeNet

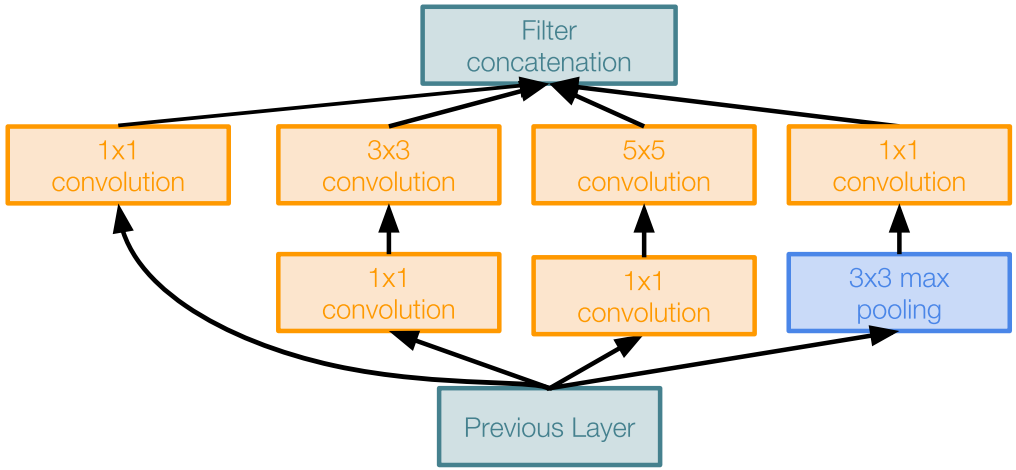
- Szegedy et al. (2014)
- key idea: deeper networks with computational efficiency
  - 22 layers
  - efficient "inception" module
  - minimal use of FC layers
  - only 5 million parameters! (12x less than AlexNet)
    parameter 수가 굉장히 적음!!!
  - ILSVRC'14 classification winner (6.7% top 5 error)



(source: cs231n)

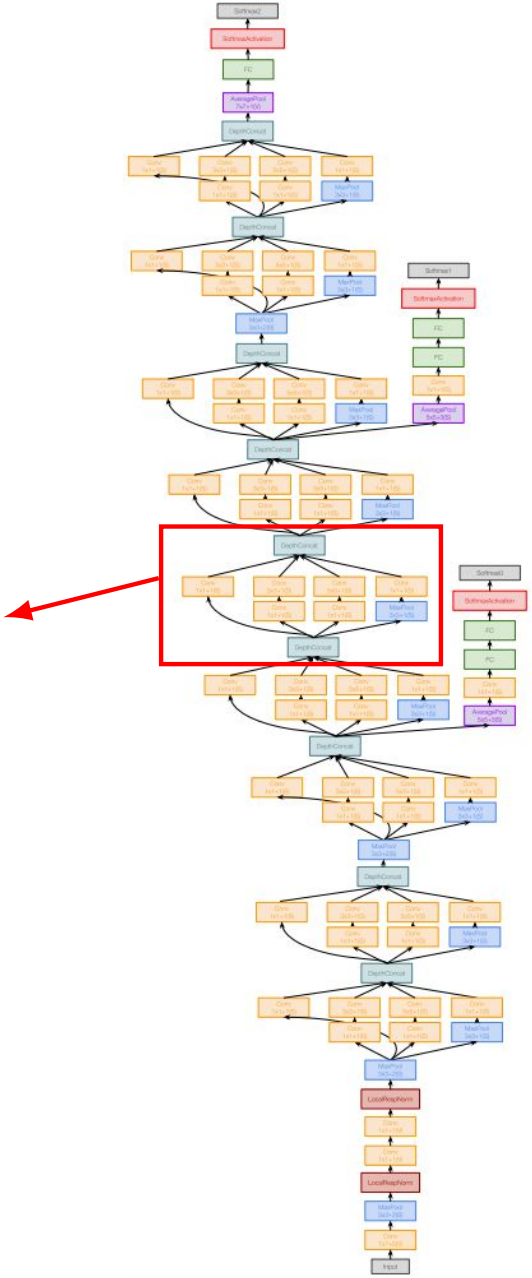
(source: Warner Bros. Pictures, http://knowyourmeme.com/memes/we-need-to-go-deeper)

- inception module
  - design a good **local network** topology (network within a network)
  - then stack these modules



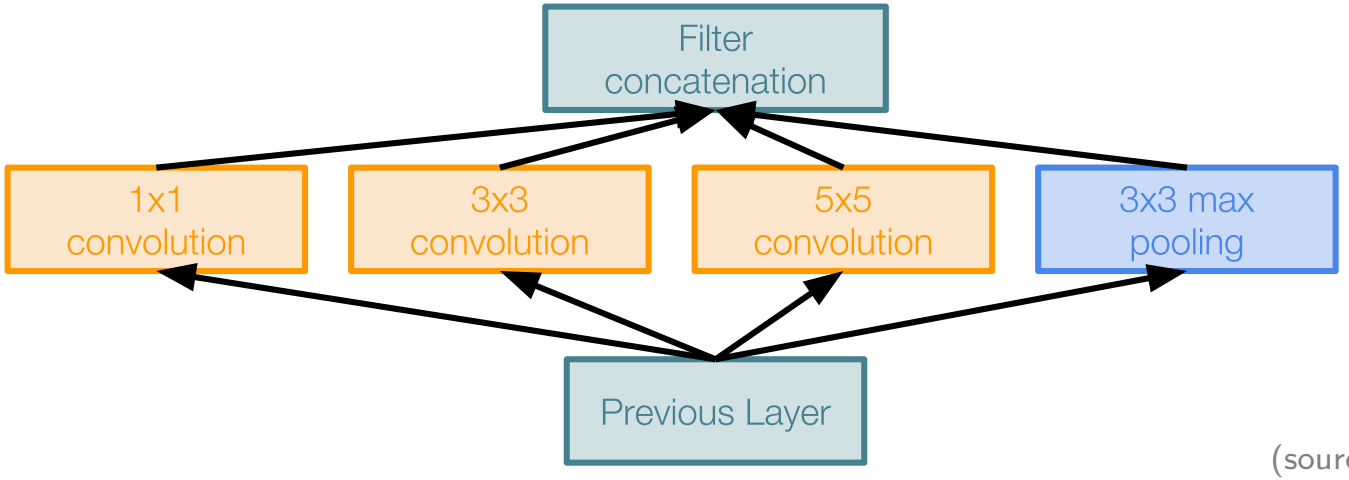
inception module

어떤 filter size가 좋을지 다 해봄
게다가 이 작업은 parallel하게 수행 가능함



(source: cs231n)

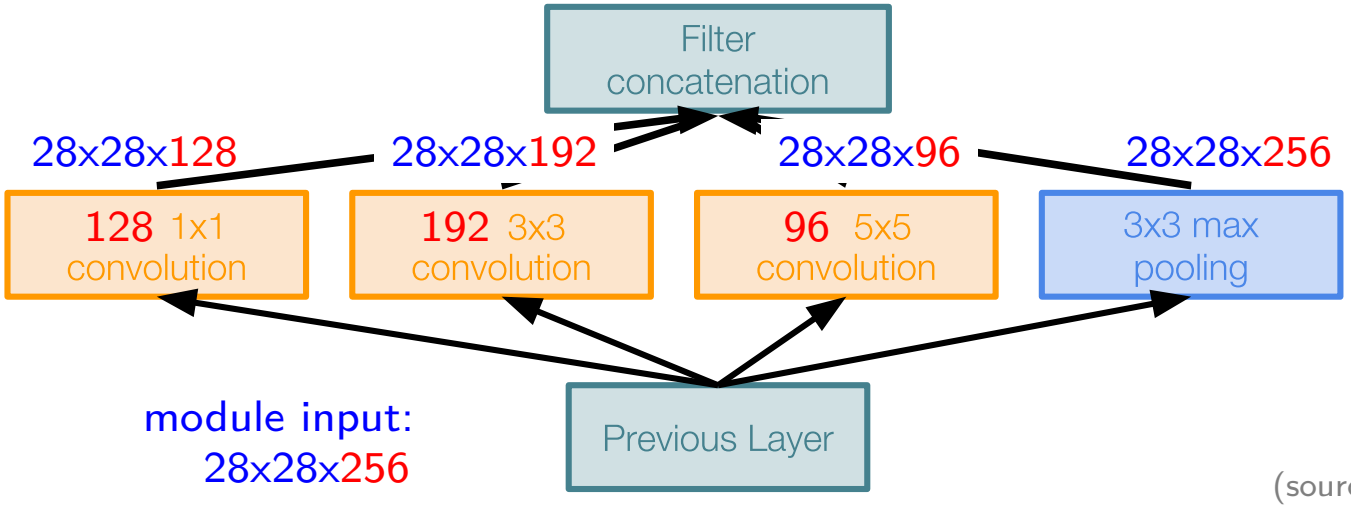
Naïve inception module



(source: cs231n)

- apply parallel filter operations on the input
  - multiple receptive field sizes (1x1, 3x3, 5x5) for convolution
  - pooling (3x3)
- concatenate all filter outputs together: depth-wise stacking

- problem with this idea: compute-intensive(expensive)

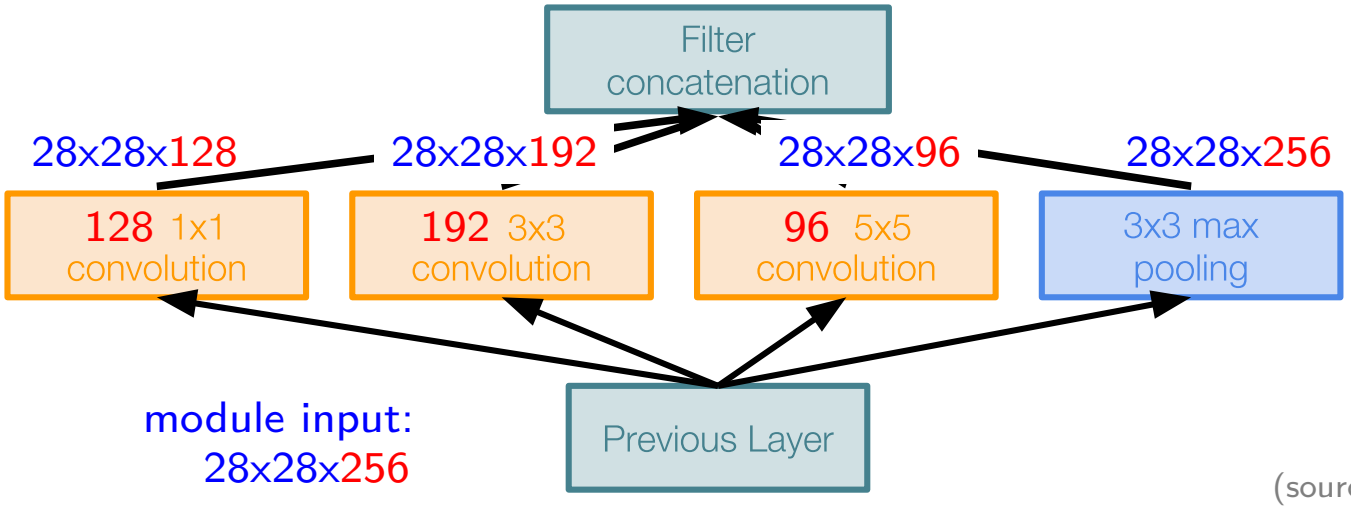


(source: cs231n)

filter의 depth는 input depth와 같으므로 256임!!! 빨간 숫자는 filter depth가 아니라 filter 갯수!!!, pooling의 경우는 빨간색이 filter depth를 의미하므로 256!

- **output size** after filter concatenation: 529k
  - 28x28x(128+192+96+256) = 28x28x672
- total number of **convolution operations**: 854M
  - $\underbrace{28\text{x}28\text{x}128\text{x}1\text{x}1\text{x}256}_{\text{(1x1 conv, 128)}} + \underbrace{28\text{x}28\text{x}192\text{x}3\text{x}3\text{x}256}_{\text{(3x3 conv, 192)}} + \underbrace{28\text{x}28\text{x}96\text{x}5\text{x}5\text{x}256}_{\text{(5x5 conv, 96)}}$

  $\Rightarrow$ very expensive to compute



(source: cs231n)

pooling layer는 depth를 유지하므로 depth-wise stacking을 하면 depth가 계속 늘어남!!!

- another challenge:
  - pooling layer preserves feature depth

  $\Rightarrow$ total depth after concatenation $\rightarrow$ can only grow at every layer

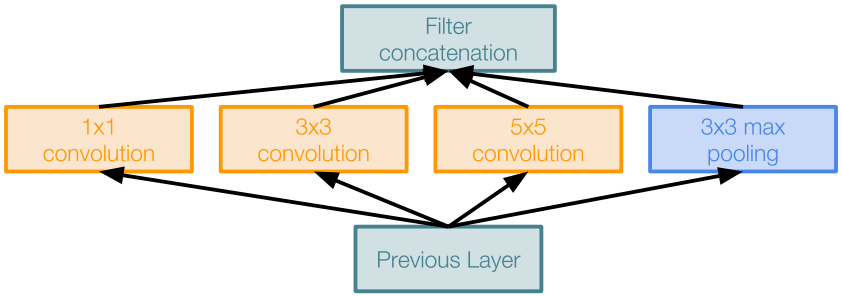
- solution
  - "bottleneck" layers

    use 1x1 convolution to reduce feature depth

Inception module

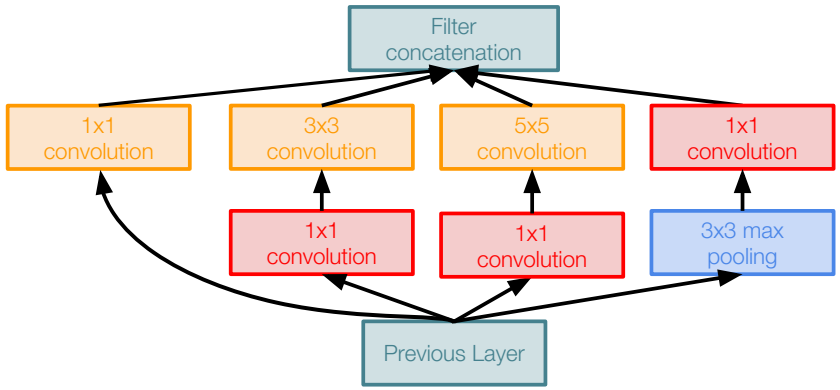
- comparison:

naïve inception module



(source: cs231n)

inception module with dimension reduction



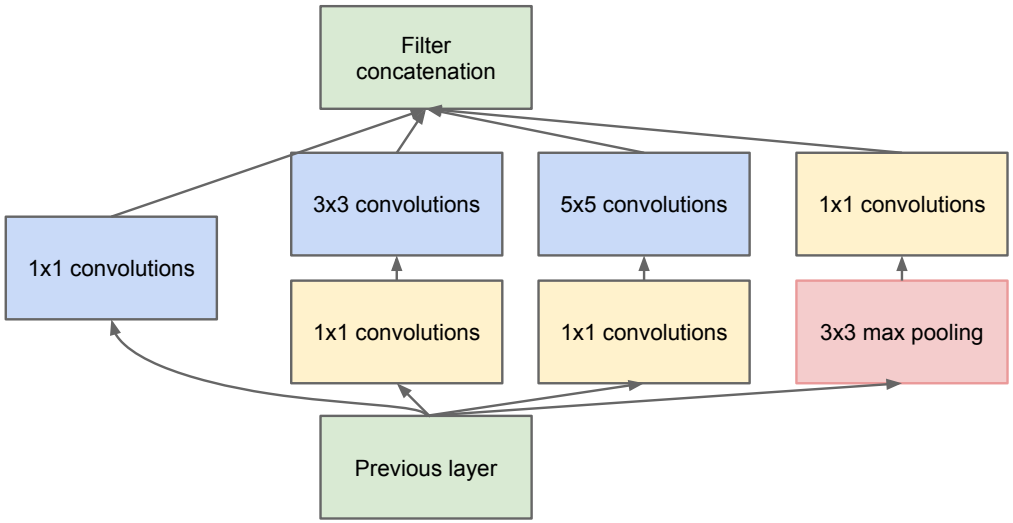
1x1 convolution(빨간 직사각형)을 통해 dimesion reduction을 수행함, pooling의 경우 dimension reduction을 먼저하면 데이터 손실이 너무 커서 pooling 이후에 dimension reduction 수행

- 1x1 conv "**bottleneck**" layers
- the same setup as on page 29:

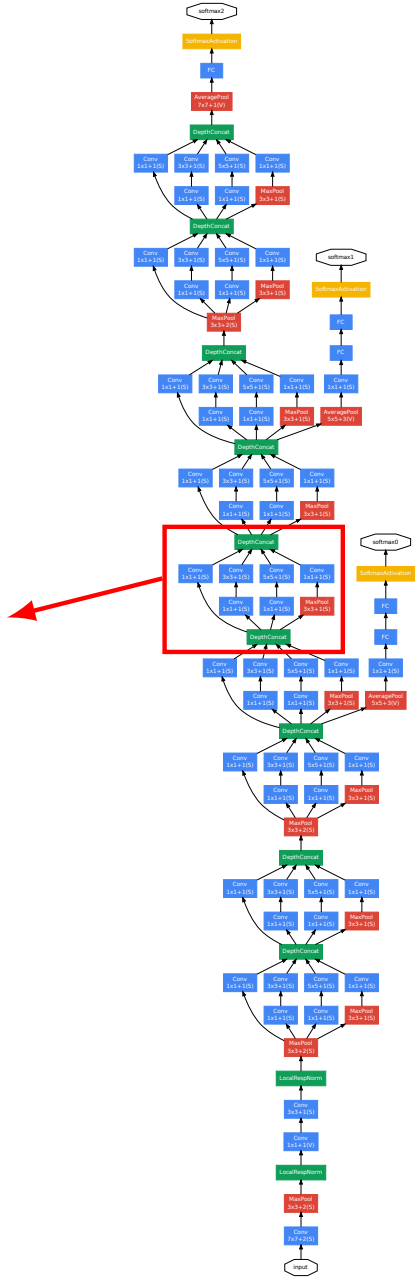
  845M ops → 358M ops

GoogLeNet

- **stacked** inception modules
  - with dimension reduction on top of each other

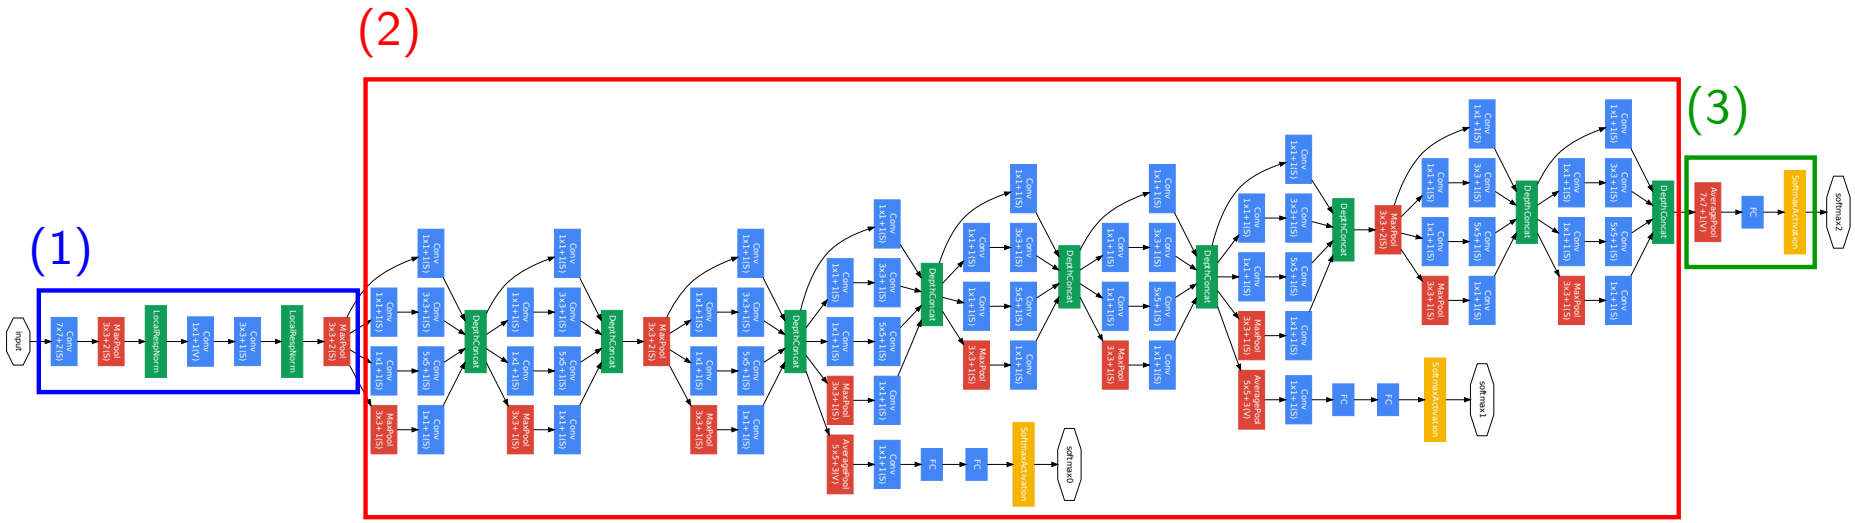


파란색 => filter size 별 convolution,
노란색 => dimension reduction
빨간색 => pooling



(source: Szegedy et al., 2014)

- full GoogLeNet architecture:



(source: Szegedy et al., 2014)

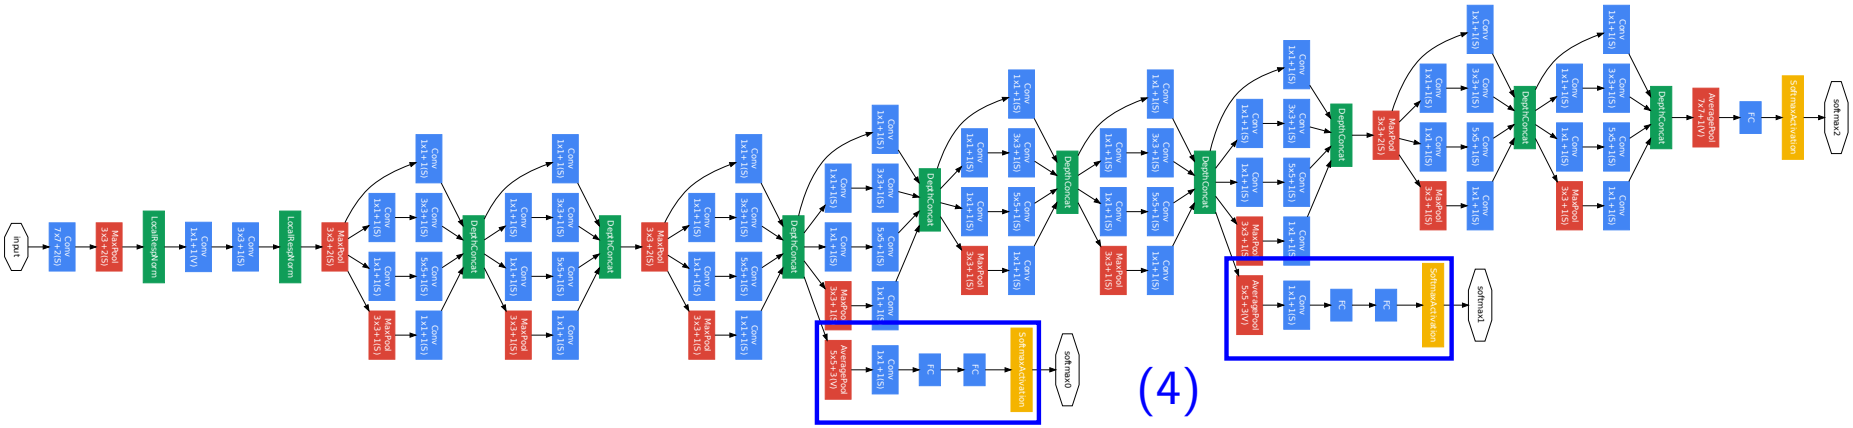
(1) stem network: CONV-POOL-2xCONV-POOL

(2) stacked inception modules

(3) classifier output

(1): 보통 맨 앞 layer에 이 작업을 수행,
(2): inception modules

- full GoogLeNet architecture:



(4) => gradient booster

(source: Szegedy et al., 2014)

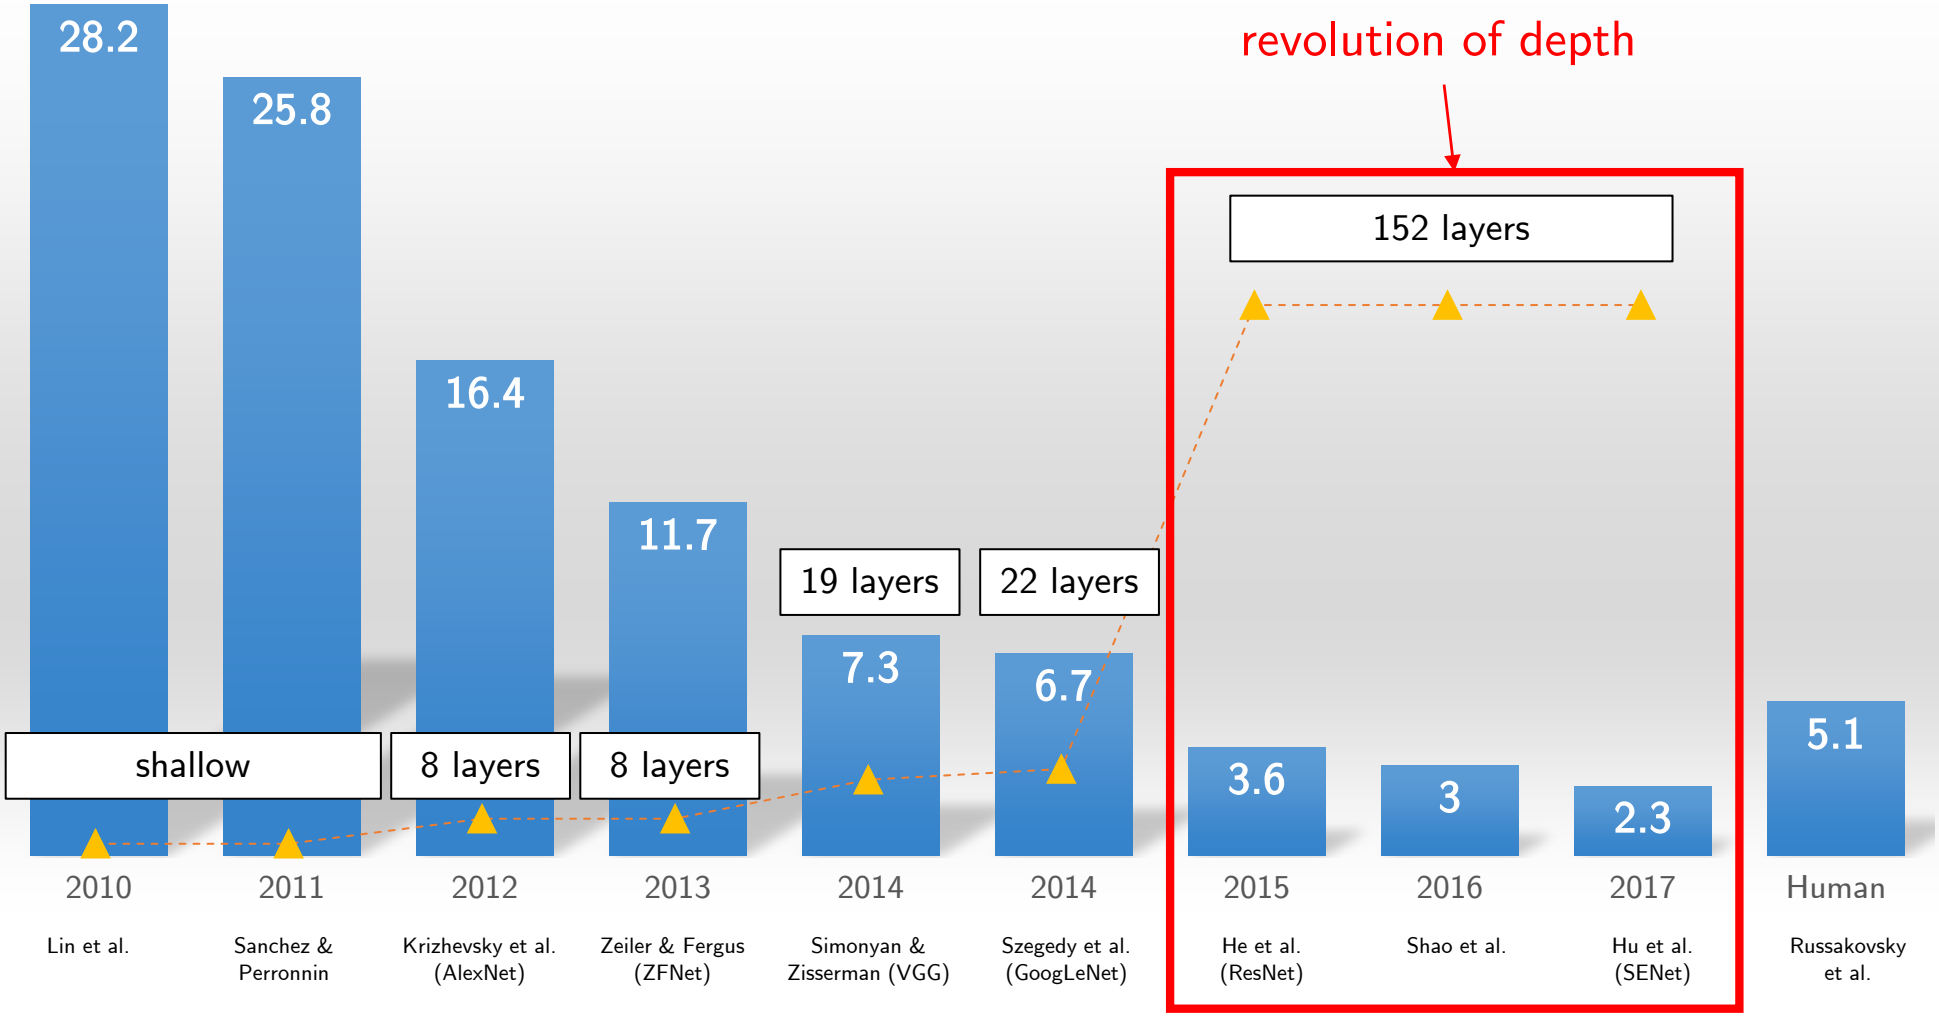
(4) auxiliary classification outputs: AvgPOOL-1x1CONV-FC-FC-SOFTMAX

- ▷ to inject additional gradient at lower layers

- total 22 layers with weights
  - parallel layers count as 1 layer $\Rightarrow$ 2 layers per inception module
  - auxiliary output layers: not counted in

Outline

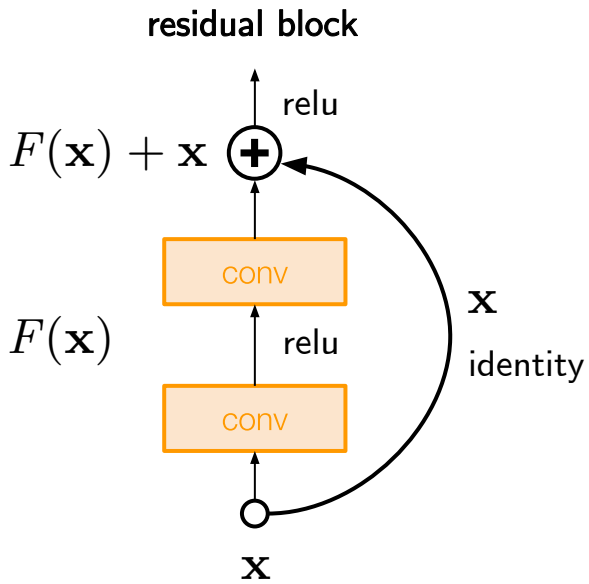
ImageNet challenge winners

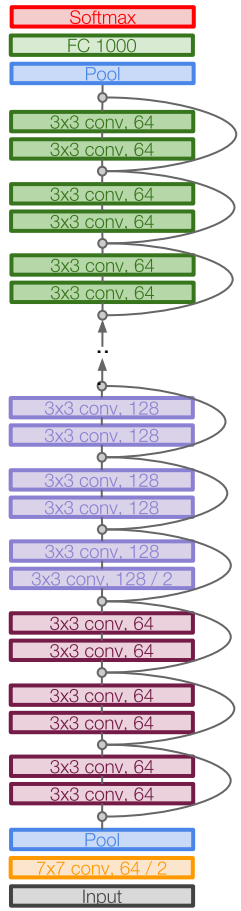


ResNet

image net을 싹슬이 한 강력한 놈

- He et al. (2015)
- key idea: very deep nets using residual connections
  - 152-layer model for ImageNet
  - ILSVRC'15 classification winner[2] (3.57% top 5 error)





(source: cs231n)

[2] swept all classification and detection competitions in ILSVRC'15 and COCO'15

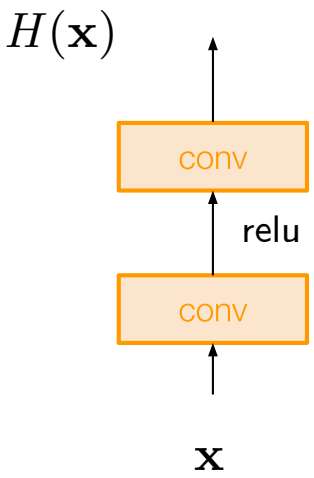
- intuition:
  - if trained appropriately, deeper models should be able to perform
    - at least as well as shallower models

- a solution by construction:
  - copy the learned layers from the shallower model
  - set additional layers to identity mapping

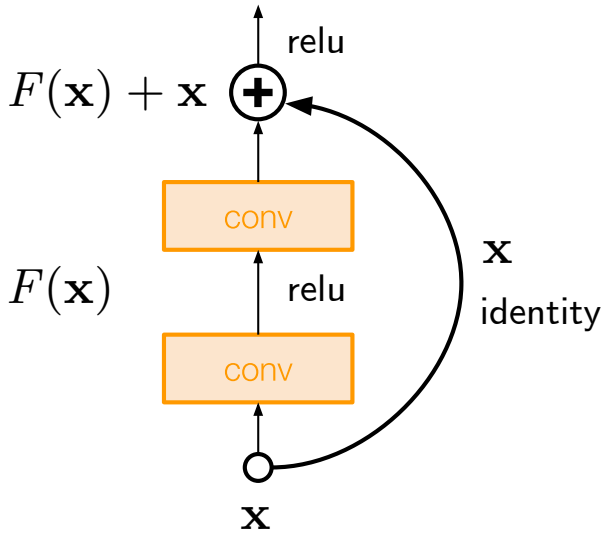
Residual block

- use network layers to fit a residual mapping: $F(\mathbf{x}) = \overbrace{H(\mathbf{x}) - \mathbf{x}}^{\text{“residual”}}$
  - instead of directly trying to fit a desired underlying mapping $H(\mathbf{x})$

“plain” layers



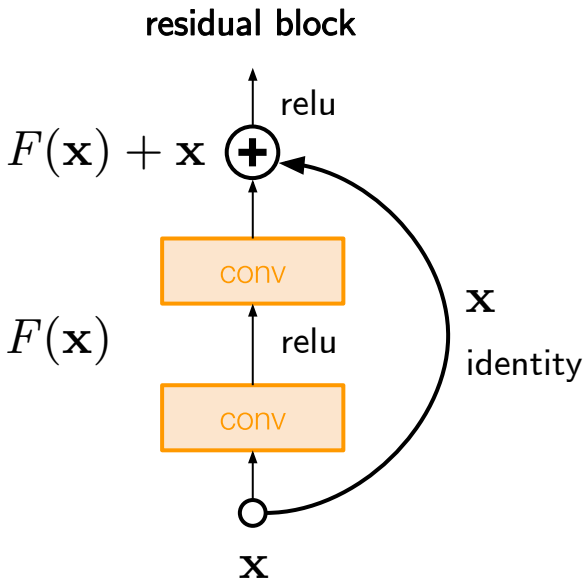
residual block

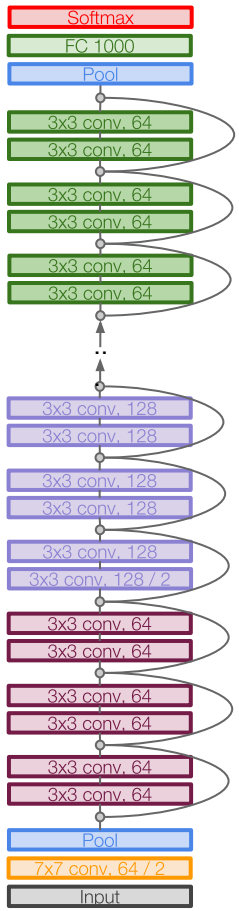


(source: cs231n)

Architecture

- stack residual blocks
- every residual block
  - has two 3x3 conv layers
- periodically
  - double # filters
  - downsample spatially (stride 2)
- at the beginning
  - additional conv layer
- no FC layers at the end
  - only FC1000 to output classes

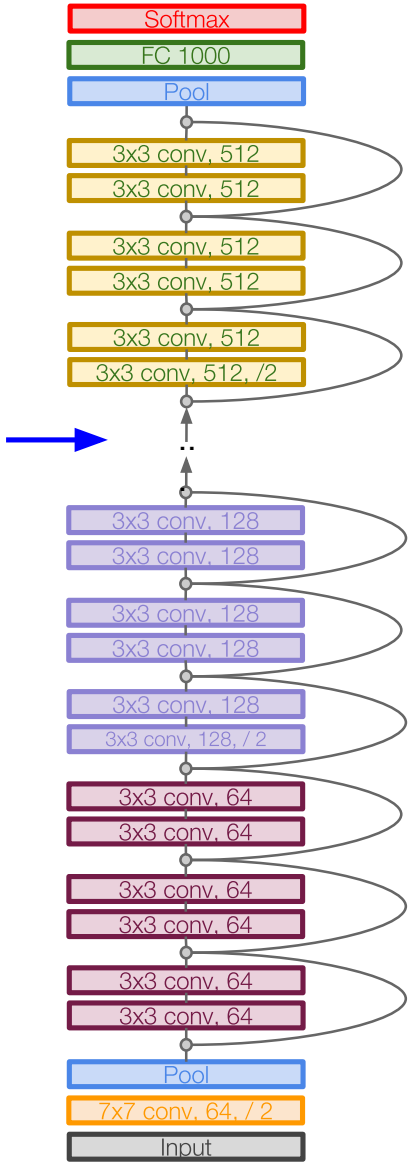




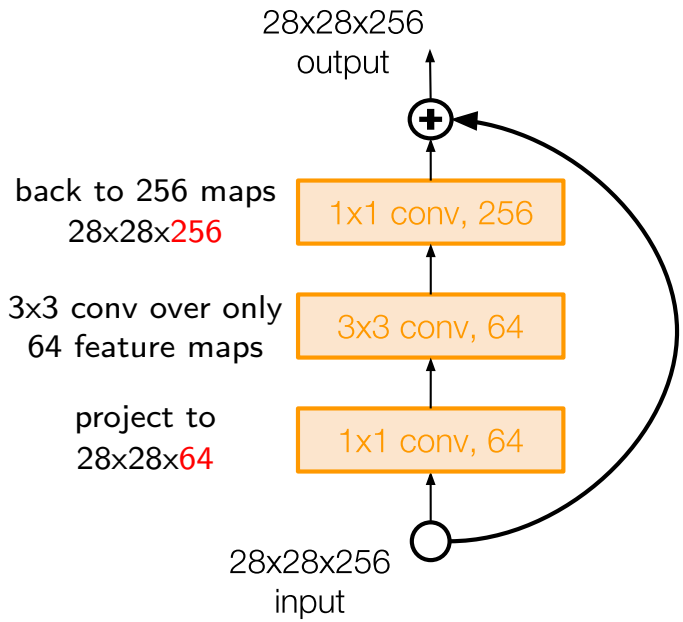
(source: cs231n)

bottle neck layer => 1x1 conv layer

- total depths:
  - 34, 50, 101, or 152 layers for ImageNet



- for deeper nets (50+ layers)
  - use "bottle neck" layers to improve efficiency (similar to GoogLeNet)



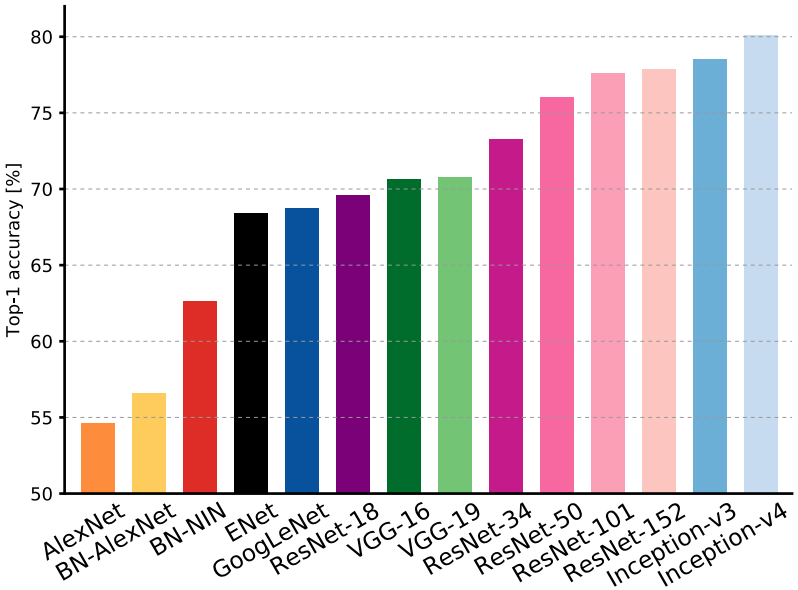
(source: cs231n)

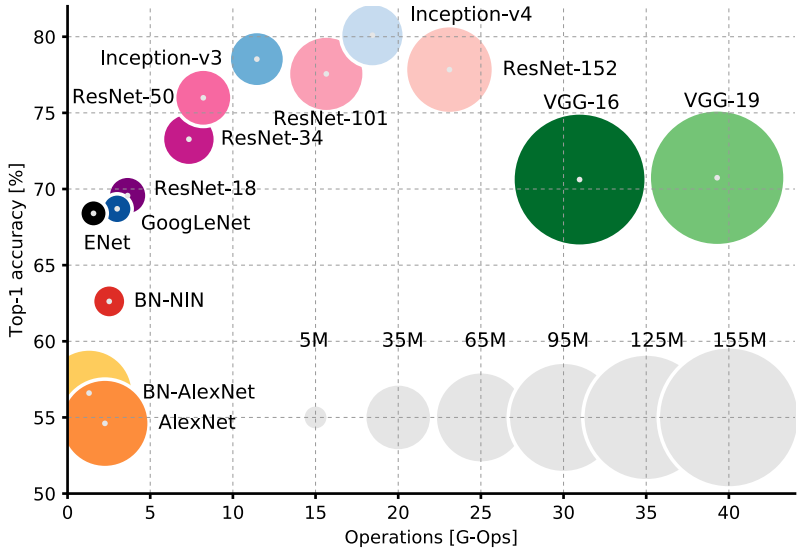
- training details:
  - *batch normalization* after every CONV layer
  - *Xavier initialization*: initial weight $\sim \mathcal{N}(0, 1/n)$ where $n = \#$ neurons
  - SGD + momentum (0.9)
  - learning rate: 0.1 (divided by 10 when validation error plateaus)
  - mini-batch size: 256
  - weight decay: 10^{-5}
  - no dropout used

- results
  - ILSVRC 2015 winner in all five main tracks (3.6% top 5 error)

better than "human performance" (Russakovsky, 2014)

Comparison[3]





(source: Canziani et al., 2017)

- Inception-v4: ResNet + Inception
- VGG: highest memory, most operations
- GoogLeNet : most efficient
- AlexNet: smaller compute, still memory heavy, lower accuracy
- ResNet : moderate efficiency depending on model, highest accuracy

[3] (in left figure) x-axis: amount of operations for a single forward pass; circle size $\propto$ # parameters

Outline

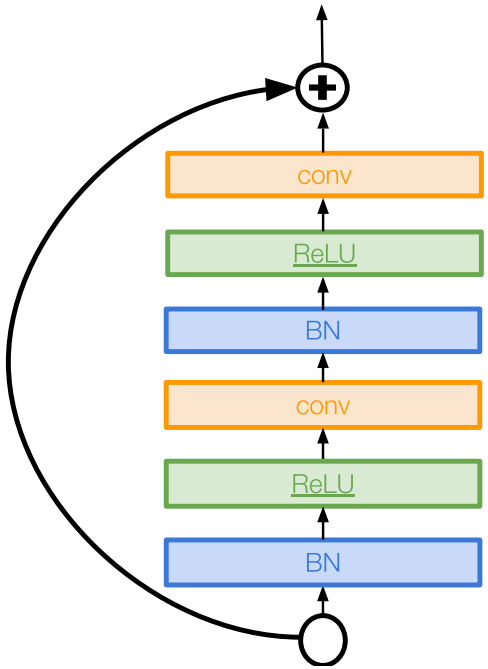
Improving ResNets

- ideas:
  - improved residual block
  - wide ResNet
  - ResNeXt
  - stochastic depth
  - multi-scale ensembling
  - feature recalibration (SENet)

Identity mappings in deep residual networks (He et al., 2016)

- improved ResNet block design
  - creates a more direct path for propagating info throughout net

i.e. moves activation to residual mapping pathway

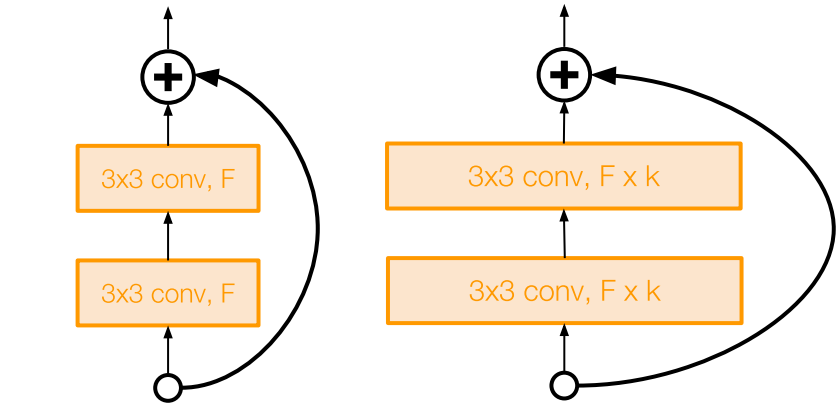


(source: He et al.)

Wide ResNet (Zagoruyko et al., 2016)

- the authors argue: residuals are the important factor, not depth
- user **wider** residual blocks
  - *i.e.* $F \times k$ filters instead of F filters in each layer
    - 50-layer wide ResNet outperforms 152-layer original ResNet
- computational benefit
  - **increasing width** (instead of depth)

  $\Rightarrow$ more computationally efficient (parallelizable)

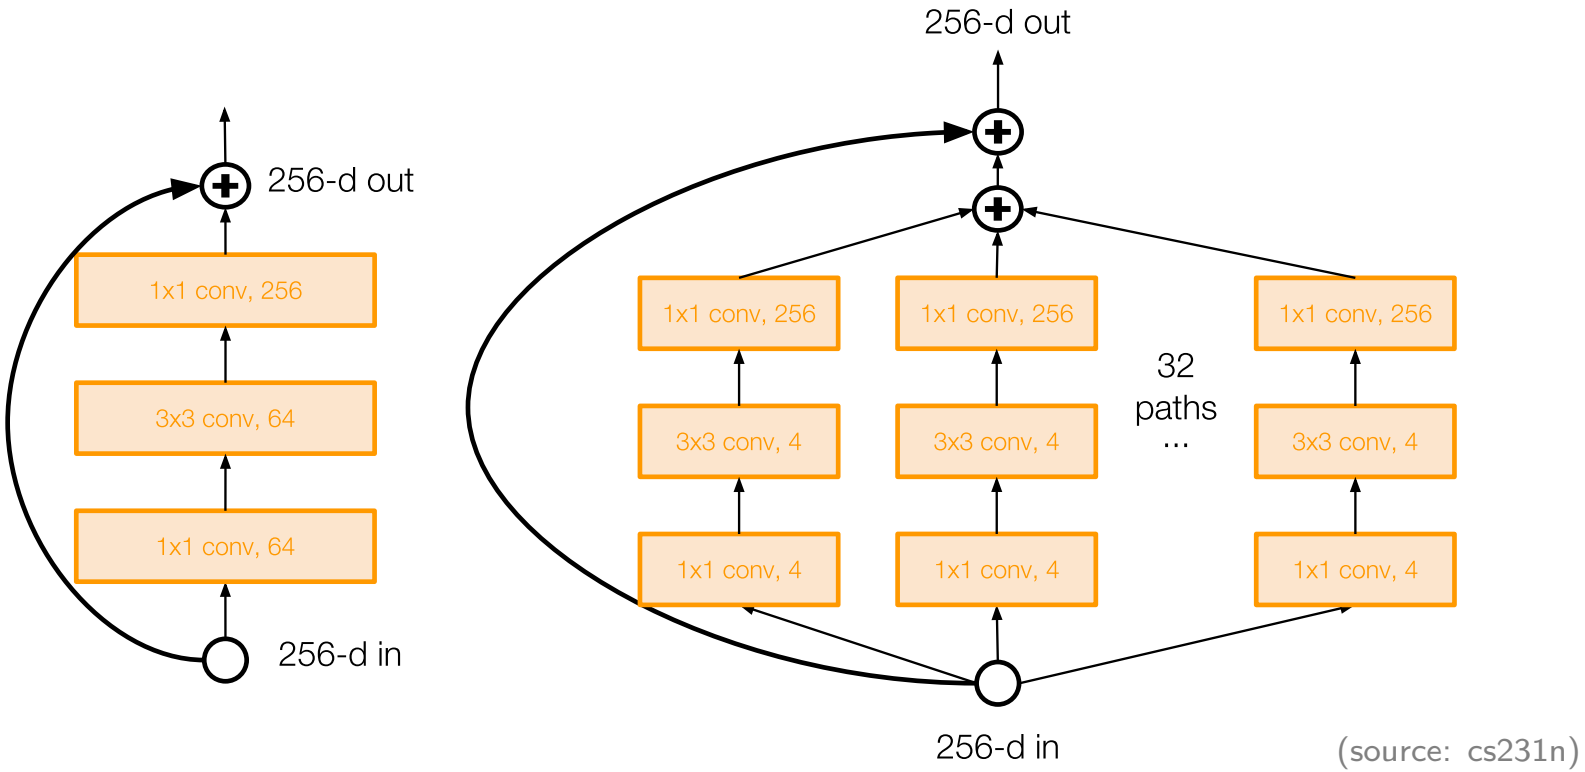


basic residual block wide residual block (source: cs231n)

ResNeXt (Xie et al., 2016)

- **aggregated** residual transformations
  - increases width of residual block through multiple parallel pathways

similar in spirit to inception module

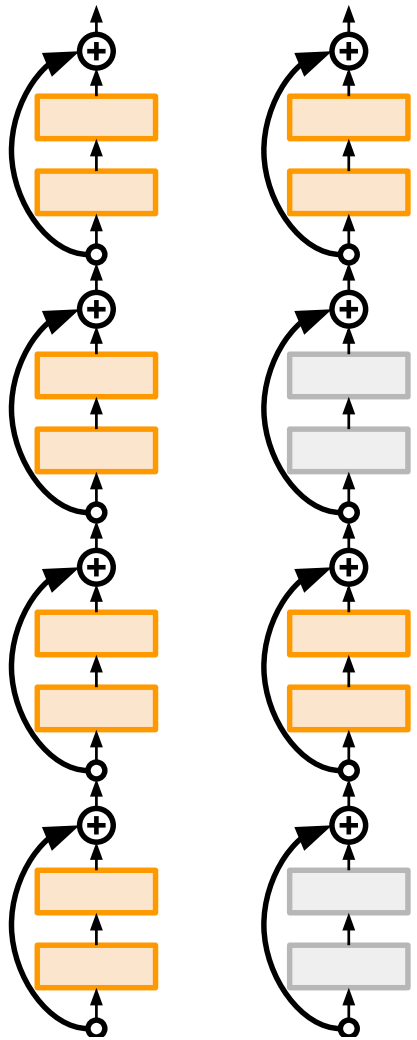


(source: cs231n)

Stochastic depth (Huang et al., 2016)

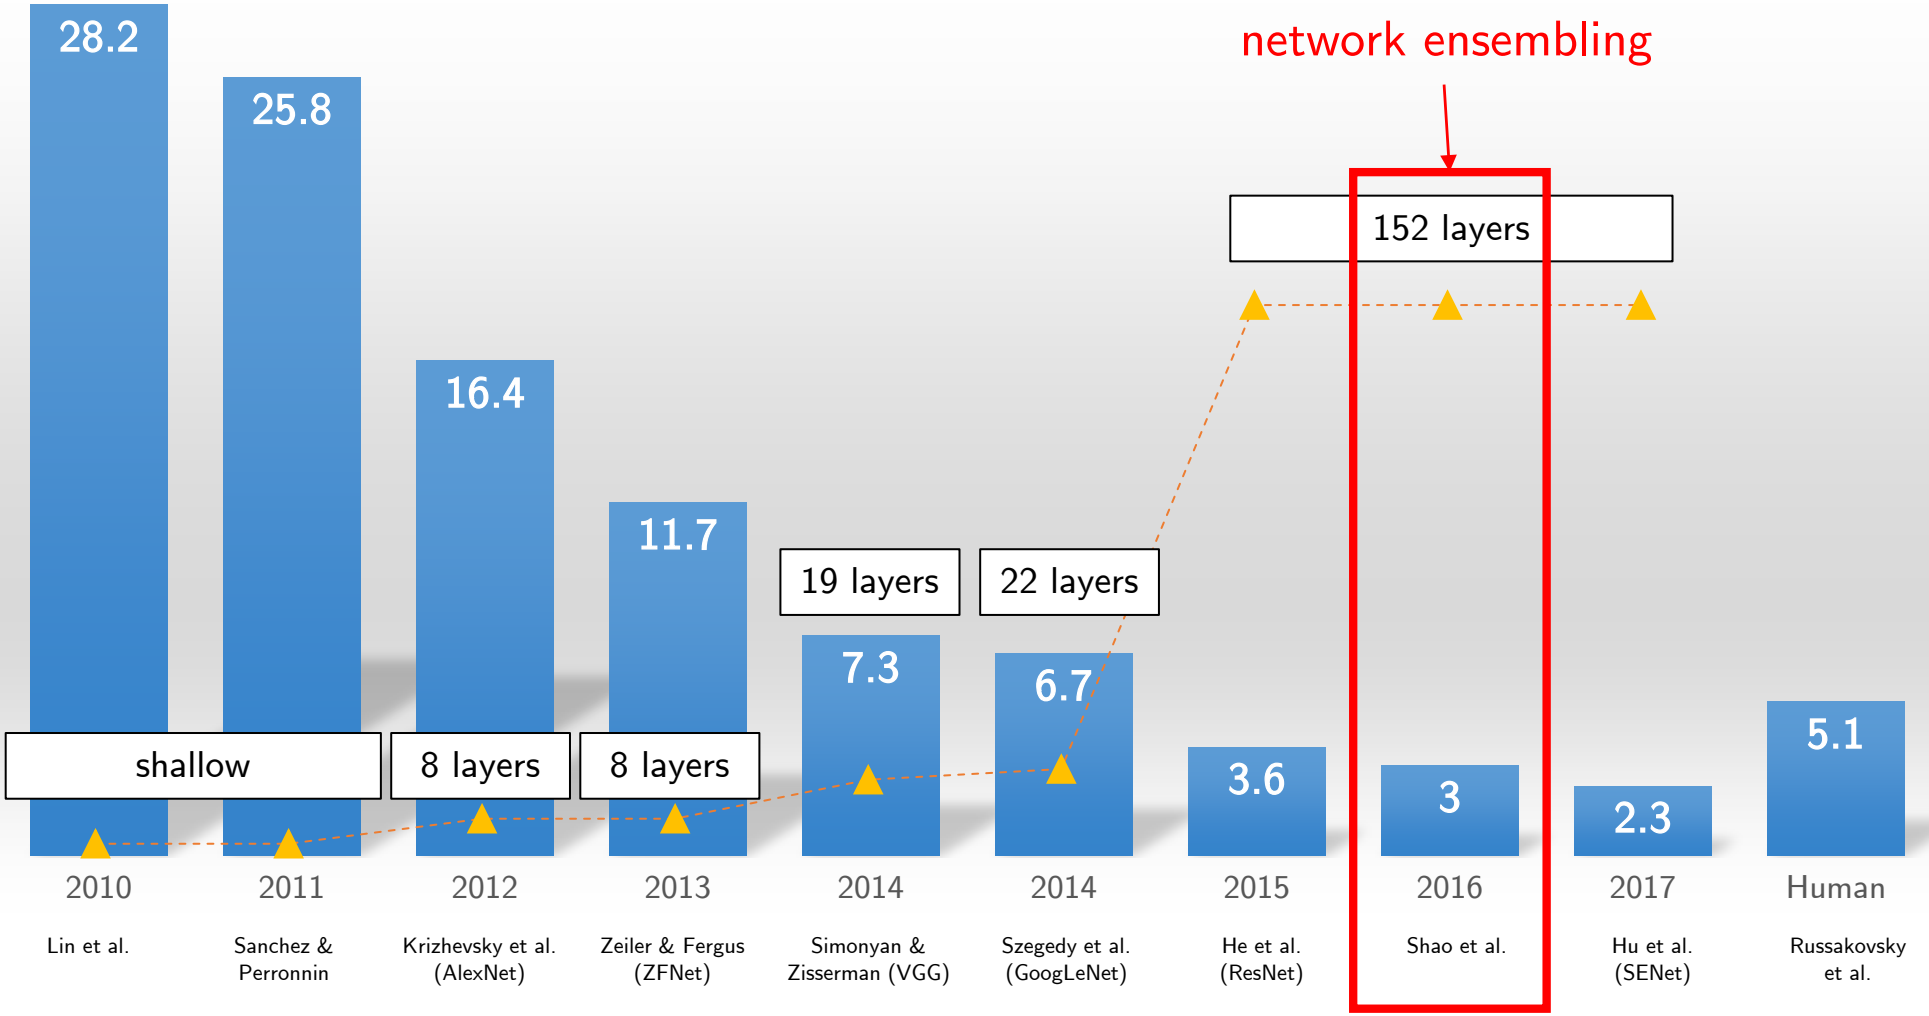
train 할 때는 일부 layer를 skip하고
test 할 때는 모든 layer를 다 통과 시키자
=> regularization에 도움이 됨

- motivation:
  - reduce vanishing gradients and training time through short networks during training
- details:
  - randomly drop a subset of layers during each training pass
  - bypass with identity function
  - use full deep network at test time



(source: cs231n)

ImageNet challenge winners

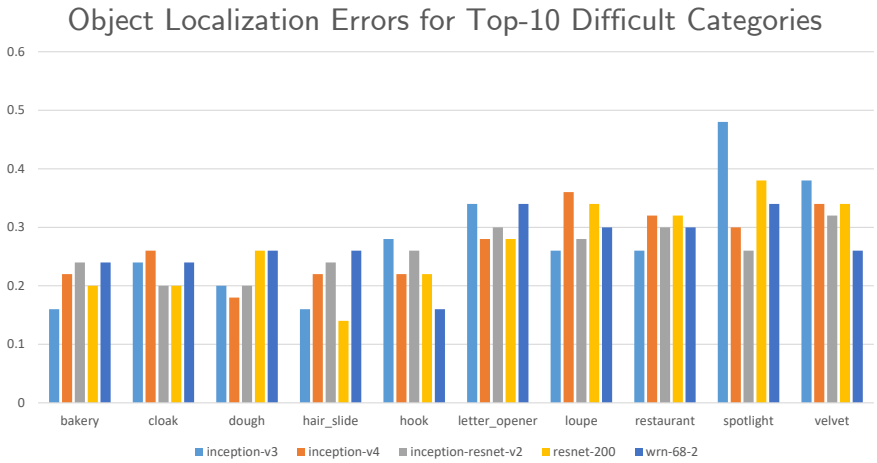


Multi-scale ensembling (Shao et al., 2016)

ensemble
=> 여러 model을 섞는 것
=> contest 등 에서는 무조건 하는게 좋음

- ILSVRC'16 classification winner[4]
  - "Good Practices for Deep Feature Fusion"

- idea: multi-scale ensembling of
  - inception, inception-ResNet, ResNet, wide ResNet models

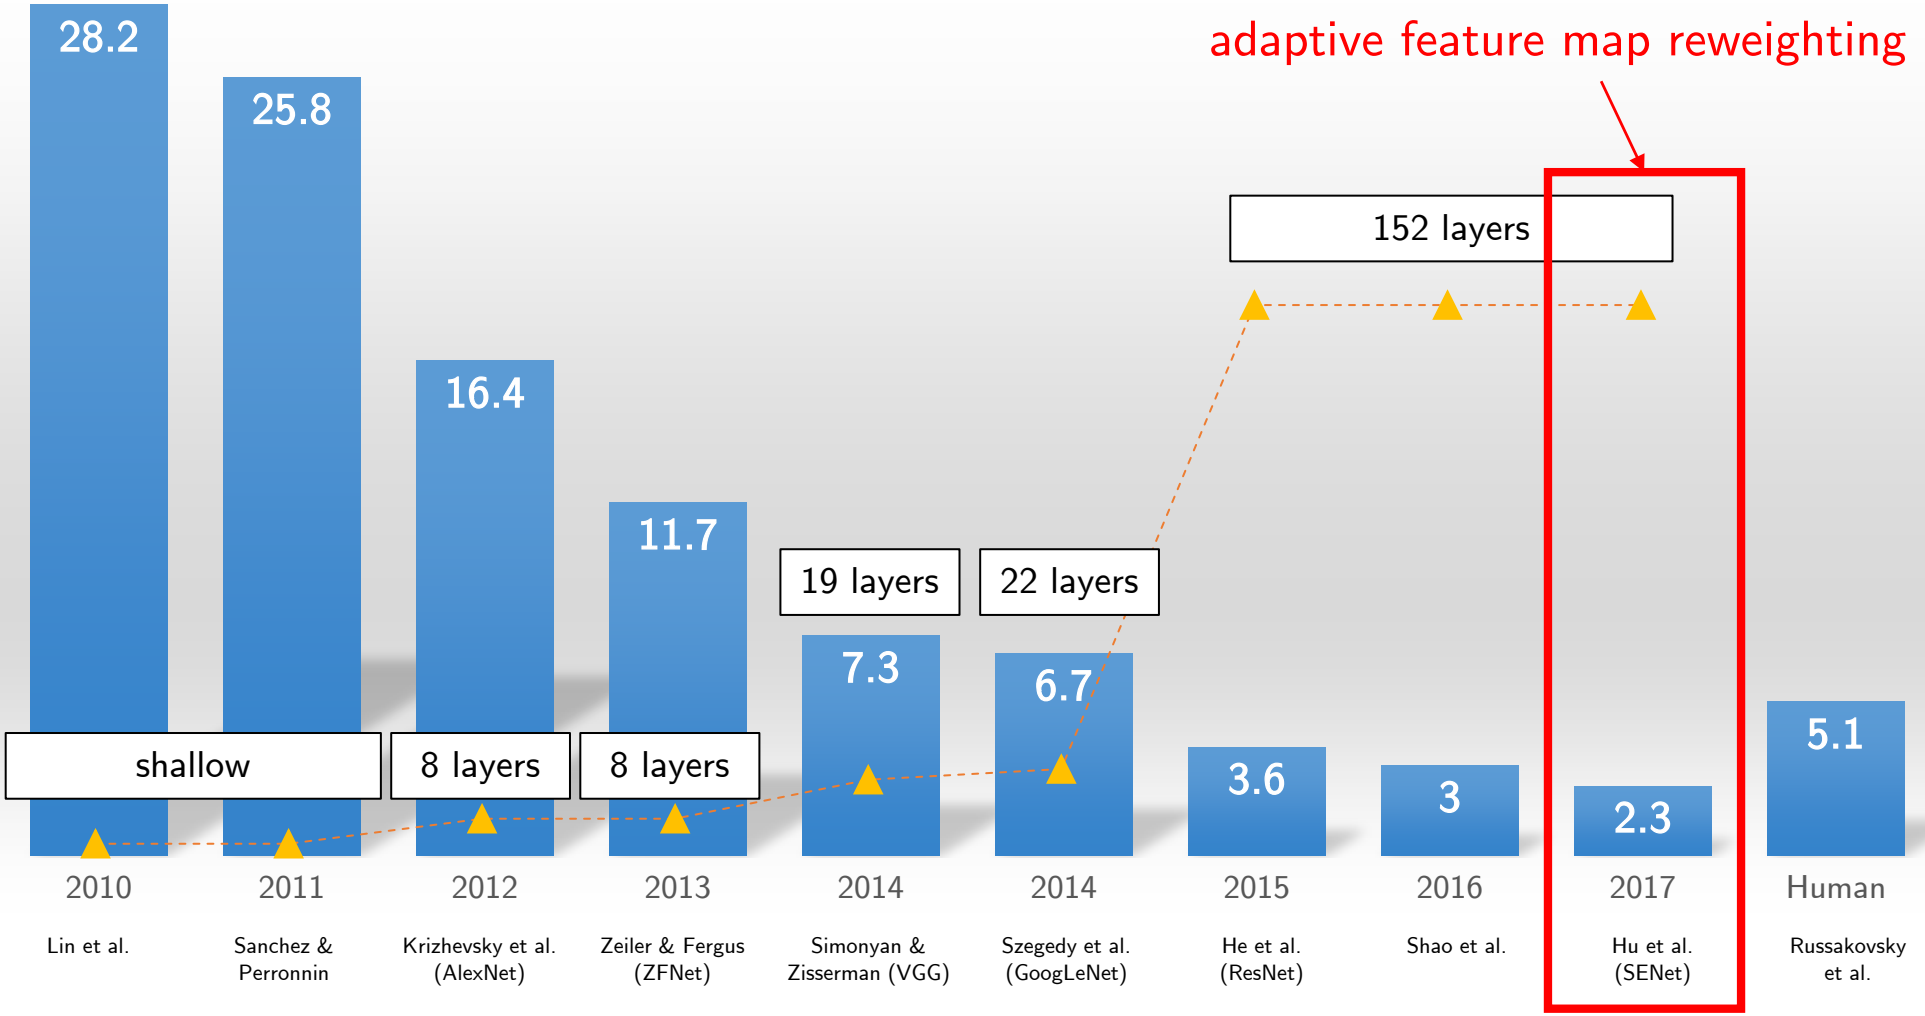


(source: Shao et al.)

method	error (%)
Resnet-200	4.26
Inception-v3	4.20
Inception-v4	4.01
Inception-Resnet-v2	3.52
Fusion (val)	2.92
Fusion (test)	2.99

[4] the authors: The Third Research Institute of the Ministry of Public Security, China

ImageNet challenge winners

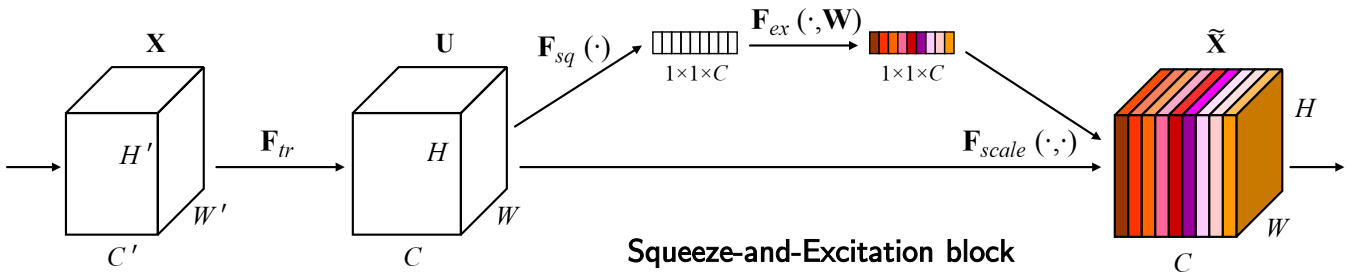


Squeeze-and-Excitation Networks (SENet) (Hu et al., 2017)

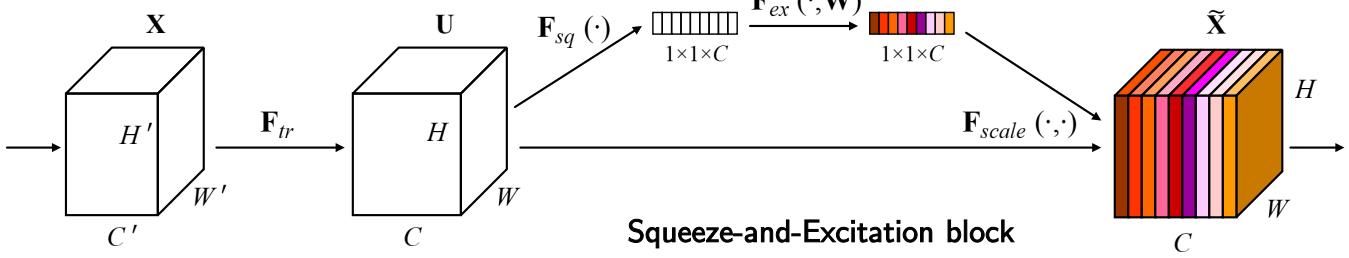
- ILSVRC'17 classification winner
  - base architecture: ResNeXt-152
  - introduces SE block (applicable to a variety of nets)
    - squeeze: global information embedding
    - excitation: adaptive recalibration
- main idea:
  - improve representational power of a network

conv 채널의 dependency 이용
각 채널의 weight를 구해서 input에 적용
??????

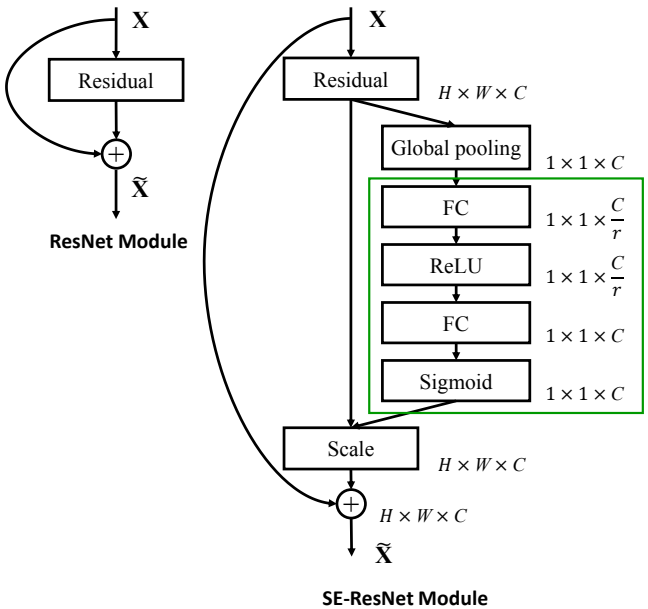
↑
by modeling interdependencies between channels of conv features



(source: Hu et al.)



- $\mathbf{F}_{tr} : \mathbf{X}^{H' \times W' \times C'} \mapsto \mathbf{U}^{H \times W \times C}$ (a conv operation)
- $\mathbf{F}_{sq} : \mathbf{U}^{H \times W \times C} \mapsto \mathbf{Z}^{1 \times 1 \times C}$
  - global average pooling (each feature map $\rightarrow$ a scalar; depth maintained)
  - "global information embedding" (squeeze)
- $\mathbf{F}_{ex} : \mathbf{Z}^{1 \times 1 \times C} \mapsto \mathbf{S}^{1 \times 1 \times C}$
  - $\underbrace{\text{FC} \rightarrow \text{ReLU}}_{\text{compress}} \rightarrow \underbrace{\text{FC} \rightarrow \text{Sigmoid}}_{\text{decompress}}$
  - to calculate scale for each feature map
- $\mathbf{F}_{scale} = \mathbf{S}^{1 \times 1 \times C} \odot \mathbf{U}^{1 \times 1 \times C} = \widetilde{\mathbf{X}}$
  - reweight feature maps
  - "adaptive feature recalibration" (excitation)



Recent developments

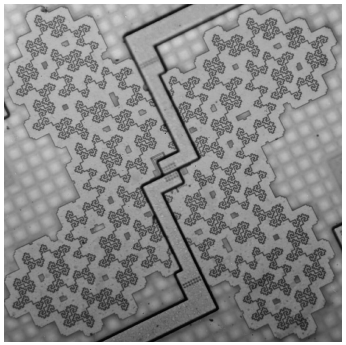
- beyond ResNets:
  - ultra-deep neural networks without residuals (FractalNet)
  - densely connected CNNs (DenseNet)
- efficient networks:
  - Caffe2Go (Facebook), TensorRT (NVIDIA), Core ML (Apple)
  - SqueezeNet
- meta/automated learning:
  - Cloud AutoML (Google)

FractalNet (Larsson et al., 2017)

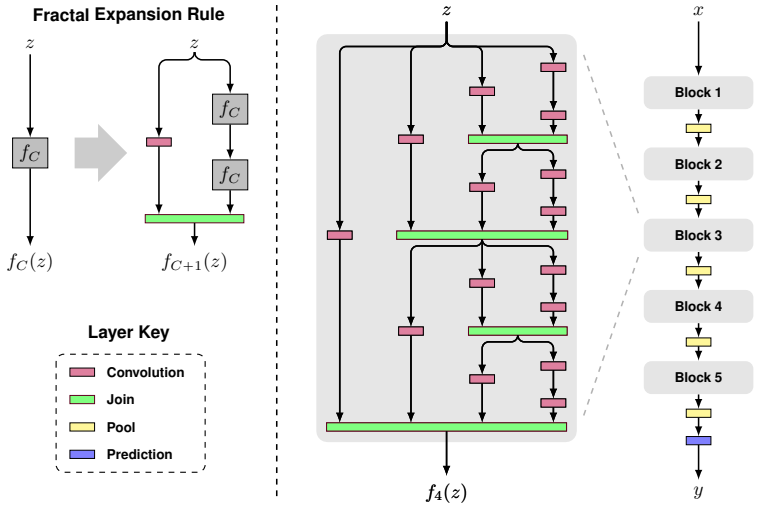
fractal => 확대, 축소해도 모양이 같음

- ultra-deep neural networks without residuals
- argue:
  - key is transitioning effectively from shallow to deep

  $\Rightarrow$ residual representations are not necessary
- propose: fractal architecture
  - both shallow/deep paths to output
  - trained with dropping out subpaths
  - full network at test time



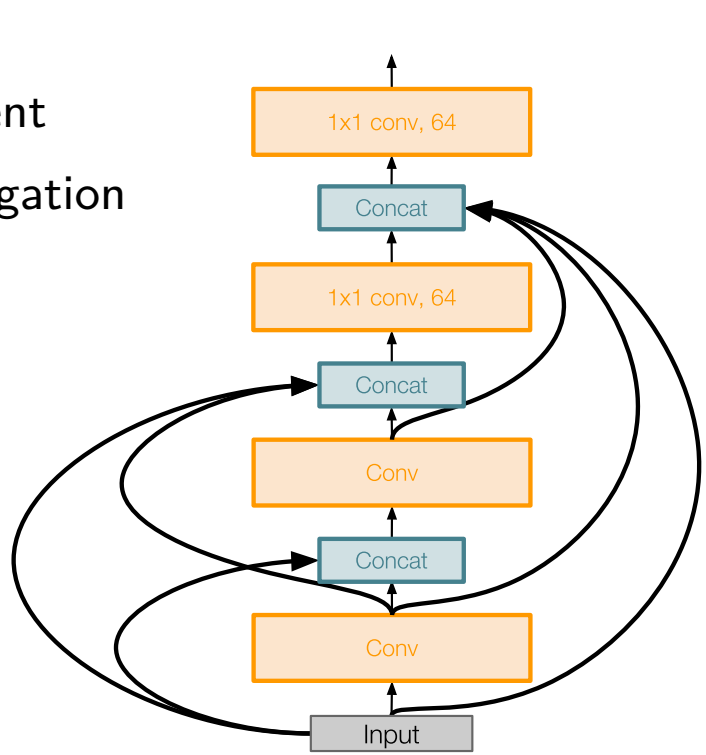
(source: Hajimiri et al.)



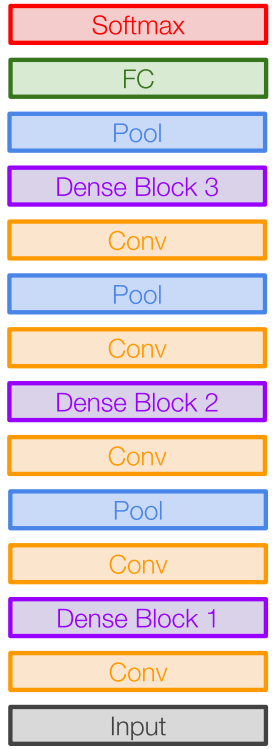
(source: Larsson et al.)

DenseNet (Huang et al., 2017)

- densely connected convolutional networks
- idea: dense blocks
  - each layer is connected to every other layer in feedforward fashion
- benefits:
  - alleviates vanishing gradient
  - strengthens feature propagation
  - encourages feature reuse



Dense Block

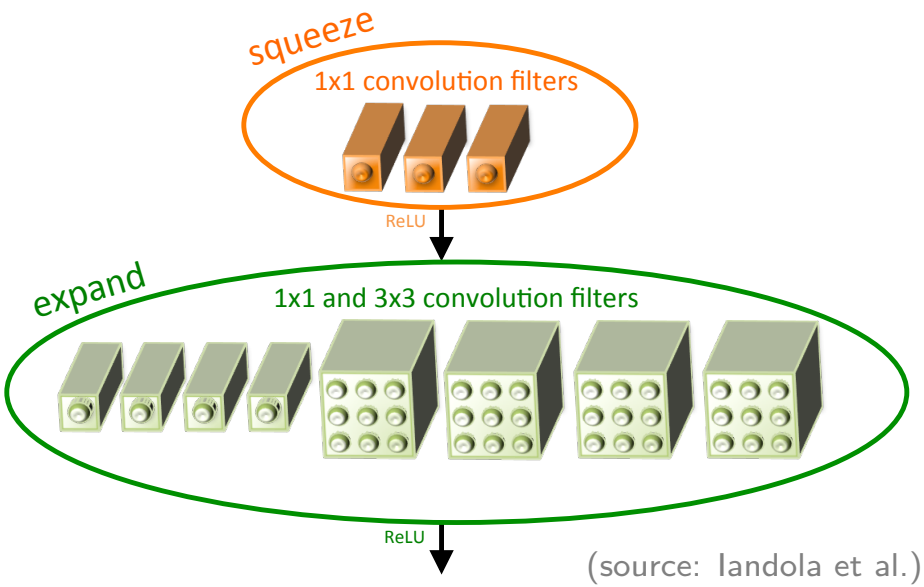


(source: cs231n)

SqueezeNet (Iandola et al., 2017)

- AlexNet-level accuracy with 50x fewer parameters and <0.5Mb model size
- architecture:
  - 'squeeze' layer (↑ 1x1 filters) feeds an 'expand' layer (↑ 1x1 and 3x3 filters)
- benefits: memory footprints
  - model size: **510x smaller** than AlexNet

light 버젼 (계산량이 적고 빠름)



(source: Iandola et al.)

Google Cloud AutoML

- learning to learn
